Year 6: 2016 – 2017
Section 1: Activities and Findings

Interdisciplinary Science and Engineering Partnership (ISEP) with Buffalo Public Schools

Year 6: 2016 – 2017 No Cost Extension 1

1. Introduction and Summary: Activities and Findings
This Activities and Findings report from the sixth year\(^1\) of the NSF MSP supported expansion of the ISEP program focuses work related to the four research questions being investigated in ISEP.

- What are science teachers’ conceptions of interdisciplinary science inquiry? How do their conceptions change through intensive summer research and ongoing professional developments?
- How do science teachers translate interdisciplinary science inquiry experiences and understanding gained in university research laboratories into their classroom inquiry instructional practices, i.e. how do science teachers develop interdisciplinary science inquiry PCK?
- How do professional learning communities (PLC’s) support teacher development of interdisciplinary science inquiry PCK?
- What are the processes of STEM students developing understanding of interdisciplinary science inquiry and abilities to communicating science to middle and high school science teachers and students?

As ISEP has developed from a pilot study in 2005-2010, five major activities have been identified as central to the ISEP mission as described in the Strategic Plan:

i. **School based Wrap Around Support**: the introduction of STEM Ph.D. graduate assistants and undergraduate service learning students to support science, technology, English as a New Language (ENL, formerly English as Second Language (ESL) and special education teachers in twelve schools in the Buffalo City School District (aka Buffalo Public Schools, BPS),

ii. **Teacher Professional Development**: the development of school based focus areas for STEM education in each school and recruitment and placement of teachers from all twelve schools in summer interdisciplinary research,

iii. **Professional Learning Communities (PLC)**: the development of networks that focus on middle and high school teachers working on content development and alignment across the STEM fields, with special focus on linking feeder middle schools to high schools, inclusion of parents into the PLC, defining the roles and participation of ISEP faculty and graduate students,

iv. **Research on Teachers and STEM Graduate and Undergraduate Students**: Development, validation and implementation of tools for data collection, collection of baseline data and research into key questions outlined in the 5 year strategic plan and

v. **Support for summer activities (research/camps) for middle and high school students and support for field trips for students during academic year.**

The reports of activities will focus on the MSP five key features: Partnership Driven, Teacher Quality, Quantity and Diversity, Challenging Courses and Curricula, Evidence-Based Design and Outcomes and Institutional Change and Sustainability.

Highlights from the sixth year of the NSF support for ISEP include:

- **Research results reported in two new papers from a Ph.D. dissertation** detailed in the research section of this portion of the report (part 5 below).
- **Support for implementation and dissemination of research based placement of 71 teachers in summer professional development (PD) in 2016**, including 56 teachers in research opportunities, 8 ESL teachers working on translation of STEM curricula, 4 teachers in support roles at schools and 5 teachers in the BSC Course,
- **application and placement of 7 teachers for summer PD along with 7 other teachers identified and supported by ISEP’s iTEST funded project in 2017**

---

\(^1\) This report represents the results from a first year (Sept 1, 2016- August 31, 2017)\(^1\) no cost extension for the NSF MSP Funding for the program components led by funding supporting activities at the University at Buffalo, Buffalo Public Schools, Buffalo State College, Buffalo Museum of Science and Miami University. A second, six month no cost extension was approved by Dr. David Haury at NSF for Sept 1, 2017-February 28, 2018) which will complete the grant funded programs in ISEP.
development of a focused implementation plan and documentation of implementation by consulting with ISEP teachers, resulting in reporting of substantive classroom implementation in academic year 2016-2017,
development of a focused dissemination plan for other teacher in Buffalo Schools with completion of a third year of funding awarded for the a BPS/ISEP application to New York State Education Department MSP that brings ISEP work into the academic year PD for all 7/8th science teachers,
implementation of the strategic plan for ISEP sustainability following the end of NSF MSP support in a series of grant submissions to supplement and expand ISEP work, including New York State funding, NSF INCLUDES, ITEST, AISL and STEM+C, US Dept of Defense/Office of Naval Research and US Dept. of Education IES and an award as a STEM Ecosystem from the STEM Funders Network of 27 private foundations, building toward integration of ISEP collaboration with higher-ed, corporate partners for STEM PD and support into the BPS budget,
The award from NSF for an application to the ITEST program based on the development of a novel GIS Summer teacher and student camp to teach programming and mapping for GIS analysis using smartphones and drones, with year round after school programs and year round career counseling for students.
The continued development of a STEM Ecosystem based Theory of Action for ISEP, with support from the STEM Funders Network STEM Ecosystem national program,
The further utilization of the STEM/ENL initiative of translated 8th/9th grade Living Environment (NYS Regents Biology course) into languages of importance to Buffalo’s growing Immigrant/Refugee population, including oral and written translations into Arabic, Burmese, Somali and Nepali. Furthermore, aligned with the NYS standards of learning language through content, ISEP created a Pictionary of tier I and tier II vocabularies.
Development and implementation of a computer science initiative at the middle and high school level that included development of partnerships with small information tech businesses and local start-ups. In particular, ISEP has piloted Thimble.io at Bennett High School with ISEP teacher Pat McQuaid with continuous visions to expand the partnership model and materials.
ISEP sponsored public events, including the Annual Teacher Poster Presentation on December 13, the Student Science Summit on March 11 (see narrative below in PLC report), school based STEM or Science Nights.
ISEP Videos this year included an invited video for NSTA TV at the 2017 meeting in Los Angeles, created in collaboration with WebsEdge. The link is https://www.youtube.com/watch?v=yKs3p-Xwp3Y, ISEP was also featured in a video for the University at Buffalo’s celebration of student academic excellence in April 2017.
Pilot and development of STEM Community School Events that are supported by BPS Community School Initiative
The newer and mobile friendly version of the ISEP website has been created and additional information is being added gradually. The ISEP website will has increased materials discussing the specifics of the teacher projects in a user-friendly resolution. But more significantly, a platform of ISEP work has been documented through a shared Google Drive.
award of additional funds from Praxair to expand corporate commitment to ISEP

The issues that have complicated ISEP progress in year 6 include:
• Due to budget limitations, ISEP was not able to fund many field trips and supplies were purchased on a need-only basis. Many funding requests for supplies which were deemed expensive were denied. This has caused a bit of low morale amongst teachers.
• Leadership and action in Buffalo Schools has been complicated by a Board of Education that is split along racial lines, with some members introducing political and ideological evaluation of BPS leadership. This has complicated ISEP work with schools and partners, often being pitted against NY State Ed School Turnaround initiatives. Some of the tension has been relieved by the removal of one member of the Board. As noted above, the Superintendent and his leadership team has engaged ISEP higher education faculty in planning new high school programs.
• Understanding of ISEP mission, goals and operation has increased throughout the district and principal leadership has made up for some of the political issues. This is reflected in the continuing strength of teacher applications to ISEP for summer PD.

Besides UB’s participation in hosting many of the summer research opportunities for teachers, and participation (see Management Report) of Buffalo Public Schools leadership in collaborating on management of the ISEP program, other Core and Supporting partners made significant commitments in the past year that should be highlighted.

• **Buffalo State College (core partner) report in Appendix 1** Buffalo State College faculty provided strong support for Ecosystem activities. BSC also provided exceptional collaborative support in the development of a computer science PD initiative, with existing CS collaborations between BSC, UB and the local CSTA chapter creating the environment to propose a specific initiative between CS and Career and Technical Educators (CTE, aka Technology) in BPS (see report, Appendix 1)

• **Buffalo Museum of Science (core partner) report in Appendix 2** continued their support for informal science opportunities, summer enrichment, quarterly Family Science Nights, along with the curricular support and after school programs for School 59. Many events are held regularly at the Museum, such as the ISEP Student Science Summit (see PLC report below) and planning to optimize the major exhibitions are complemented by the completed renovation of space to make more hands on workstations for use daily by School 59, which is adjacent/connected to the museum, along with other hosted field trips by ISEP schools. Further BMS Director of Science Learning Karen Wallace has led the submission of an ISEP application to the AISL program in fall, 2015, which was declined. Resubmission is being planned presently.

• **Praxair Technology Center (Corporate supporting partner)** hosted three teachers each summer with partial support of the finances in 2016 and 2017.

• **District Parent Coordinating Council (DPCC, supporting partner), complemented by the Buffalo Parent Teacher Organization (BP TO)** have come together to form a consistent parent leadership for the district’s academic plan and initiatives like ISEP. Following five years of developing parent involvement specific for ISEP, we collaborated directly with parent leadership on events and community school activities.

• **Over the past six years, a number of service learning students made long term commitments to ISEP schools and classrooms.** 2017 saw the graduation of four students from UB’s Honors College who had represented ISEP in schools for four straight years. These and many other students have consistently utilized their experiences in ISEP service learning as part of their dedication to broader impacts from their education to compete for major scholarships and fellowships. ISEP students have been awarded 2 Marshall Fellowships (Phillip Tucciarone presently a Ph.D. candidate at Oxford in Chemistry and Sean Kaczmarek who completed his MSc Social Policy and Social Research, Institute of Education, University College London on the effects of teacher professional development methods), numerous Fulbright Fellowships, and been finalists and Honorary Mention for Truman Fellowships. The University at Buffalo has an annual award dinner for these students. Each year, Professor Gardella gathers the students who participated in ISEP for a picture, and here is the 2017 picture. Shown from left to right are Walker Gosrich, Matthew Falcone, Hannah Santanam, Prof. Gardella, Sushmita Gelda, Antara Majumdar (Sushmita and Antara both worked for four years at School 31), Jacob Caldwell and Andrew Stewart.
ISEP Programmatic Highlights

a. Development of an ecosystem based Theory of Action for ISEP

As noted above, the development of an Ecosystem model for describing and documenting the theory of action is underway, using general organizational thought brought by Bronfenbrenner (Bronfenbrenner 1977, 1986, 1994, Gunn, Goelman, 2011) and recent work on an Ecosystem model by Zhao and Frank on technology K-12 education (Zhao, Frank, 2003). Further refinement of the theories supporting STEM Ecosystems have come from recent work by led by the Noyce Foundation (Traphagen, Trail, 2014) and documented by major publications from the National Academies Press (NRC Board on Science Education, 2015, NAS, NAE, IOM, 2016) and by work done by the STEM Funders Network (SFN) (www.stemecoystems.org), of which ISEP is a designated Ecosystem.

![Ecosystem theory of action](image)

Ecosystem theory of action, we have added a fourth hypothesis to the first three reported last year as a means to understand the relationship between student outcomes and the result of work in ISEP:

1. Development of interdisciplinary classroom materials will increase student interest and performance by providing links between science and technology classes, real world applications and college and career opportunities.
2. Teachers’ increased understanding of interdisciplinary science results in innovative classroom materials for early engagement in middle school with inquiry based hands on experimental work will sustain student interest in STEM in high school.
3. Parent involvement in STEM curricula and careers will help engage students and support teachers.
4. Classroom and after-school support of students and teachers by STEM Ph.D. students and undergraduate service learning students will promote better engagement and more inquiry based STEM learning for middle and high school students, resulting in higher grades, better scores on standardized tests and more interest in STEM careers.

Mapping these hypotheses into the three dimensional ecosystem models such as shown in Figure 1.1a will involve efforts to define the web of intersections of actions of partners and programs and translate the ISEP conceptual framework (Figure 1.1b) of ISEP into this Theory of Action.

The following is a summary of the published work (see below Part 5 Research). The ISEP Ecosystem model of collaboration from a wide variety of partners (higher education faculty, graduate student and undergraduate service learning students, informal/out of classroom STEM educators at the Buffalo Museum of Science, corporate partners and research organizations) interacting with middle and high school teachers for professional development and middle and high school students in classrooms, after school programs, summer STEM camps...
and research opportunities has been developed since 2005. Starting in 2011 with the NSF MPS, four key research questions (repeated from page 3 above) were posed:

1. What are STEM teachers’ conceptions of interdisciplinary science inquiry and how do they change through professional development?
2. How do STEM teachers translate research experiences into their classroom instructional practices?
3. How do professional learning communities (PLC’s) support teacher development in classroom?
4. How do STEM students develop understanding and abilities to communicating science to middle and high school science teachers and students?

Listed in the reference section listing ISEP publications are peer reviewed papers that were published related to questions 1 and 2 (Chi, et. al. 2016, Yang et. al, 2017, Yang, et. al (in press)) along with presentations at national and international conferences. On the issue of STEM graduate students and service learning students peer reviewed papers (Grant, et. al (2015) and Chi, et. al, 2016) and presentations the NARST international conference. Five Ph.D. dissertations were the basis for this work.

A first effort in STEM+C outcomes was reported by Razieh Fathi (ISEP (Ph.D.) Grad Assistant specializing in computer science education and Daniel Hildreth (chemistry teacher at South Park High School, ISEP active teacher for six years). The paper (Fathi, R. & Hildreth, D. (2017)) focused on integrating computational work into a high school chemistry class in a high needs school. The paper describes how a cross-curricular approach can help students reach a deeper understanding of both subjects (chemistry and computer science). A classroom backward design (Wiggins and McTighe’s Understanding by Design) methodology was used. Using this method, computer-programming concepts were introduced in Mr. Hildreth’s high school chemistry classroom using Microsoft Excel.

The most significant recent results (Yang, 2017, Yang (in press) come from the analysis of several thousand surveys as part of the ISEP evaluation program headed by Professor Sarah Woodruff and Yue Li of Miami University of Ohio’s Discovery Center. Dr. Yang Yang (Yang, et. al, (in press)) has shown, in his article “Impact of Professional Development on Teacher Knowledge, Practice and Student Understanding of Science in an Interdisciplinary Science and Engineering Partnership”, coauthored by Professors Liu and Gardella, that the ISEP professional development model has direct impact on student learning with specific components of teacher followup.

The conclusions show the relationships between Professional Development (PD) and teacher pedagogical content knowledge (PCK) assessment/classroom practice are sensitive to the content and duration of the PD program. Teacher PCK positively correlates with the participation in PD that targets methods of instruction, the effects of which appear after a certain period of time. However, teacher classroom practices in terms of support in science inquiry and attitude/expectation on student work show no relationship with the PD intervention. The significantly increased scores of teacher attitude/expectation on student work during the academic year might be captured by other factors of the PD intervention that have not been discussed in this study. It might take a longer period of time to determine whether the inquiry strategy of instruction is improved or not, and the reasons behind the change. Furthermore, the overall PD hours positively relate to student test scores and a significant increase is found at the point of 150 hours per year, thus it supports the idea that a certain amount of PD is required to show the effects on student achievement. Of course, this conclusion assumes that the PD must be of high quality and is highly relevant to the participating teachers. Moreover, the relationship between PD and student test scores is partially mediated by student understanding of NOS, though how this happens through the mediation of teacher knowledge/practice remains unclear.

This study broadens the knowledge of PD and teacher/student achievement in science teaching and learning. The statistical results of the study provide empirical evidence on the effectiveness of PD programs in terms of coherence and duration. Also, the study sheds light on how the effects of PD could finally benefit student-learning outcomes. According to the results, a certain amount of PD every academic year is needed to positively affect student understanding of interdisciplinary science, as one of the mediation factors is student understanding of NOS. Furthermore, findings of this
study can inform science teacher PD programs. First, for any PD program with a well-defined purpose, the duration of PD is essential to the overall effects. Thus, teacher PD programs that are intense and of a short duration, should be viewed with caution. Second, measurements of PD outcomes should be specific, aligned with the purpose, and allow a time period for PD to exhibit effectiveness. For example, assessment of teacher achievement after joining a research project must start with something directly related to the project. Third, the length of PD intervention is found to be effective in improving student understanding of NOS and thereby increasing the understanding of interdisciplinary science. Therefore, teachers are suggested to consistently attend PD programs and incorporate NOS into their lessons.

b. Development of a strategic plan for ISEP sustainability
As reported in the 2015 and 2016 Annual Report, with the help of ISEP Steering Committee Chair UB President Satish Tripathi and ISEP Partners we began implementing a strategy for future support of ISEP (extension and expansion) in late summer 2014. While initially focused on a submission of a new STEM-C Partnership application in 2016 and enhancement of NY State support, the phase-out of the STEM-C Partnership option initiated a more serious conversation with President Tripathi, Buffalo Schools leadership, New York State Education Department leadership and ISEP leadership. With the addition of the SFN funding for the STEM Ecosystem, and following site visits in July 2015 from NSF (David Haury and Rebecca Kruse) and Gerald Solomon from the Samuei Foundation/SFN in May 2016, a more detailed request to New York State has been developed for extension and expansion of the teacher professional development mission to teachers in all 58 Buffalo Public Schools, and a variety of increased after school and out of classroom informal STEM collaborators for support of students.

The longer term goal of sustainability planning is to develop the ISEP model of STEM teacher professional development and wrap around support activities into the budgets of the core (and some supporting) partners. This would lead to a sustainable ISEP program that would be present in every school in the Buffalo Public Schools and be translated, including a transitional funding plan, to other urban and rural high needs schools. Well-funded suburban schools would be able to support ISEP programs as part of their internal budgets.

In particular, the Buffalo Public Schools, UB, Buffalo State and Museum of Science, as core partners would commit to an ongoing internally funded program following the ISEP model of collaboration. Important corporate partners and research partners would also be engaged as part of the long term sustainable funding of such a program. This approach is founded on the definition of a core partner in NSF Math Science Partnerships, Core Partners agree to Institutional Change as part of Sustainability.

“Core partner organizations share responsibility and accountability for the MSP project. Core partner organizations are required to identify the institutional change(s) that will occur and provide evidence of their commitment to undergo the institutional change necessary to sustain the work of the partnership beyond the funding period. This is what distinguishes Core Partner organizations from supporting partner organizations.”

Besides institutional changes in practice as a result of the ISEP program, an institutional commitment to building the program into the regular budget of both higher education partners and the Buffalo Public Schools would demonstrate true sustainability and significant institutional change. One of the current Buffalo Public Schools Board of Education members, Larry Quinn, said it best “the long term success of ISEP depends on it being part of the normal BPS budget”.

The major component of the sustainability plan is a funding request from UB’s President to New York State for substantial multimillion dollar support of a level and timeframe similar to the initial MSP (5 years, $10M). This would continue a base operation for extension of the existing program and expansion over five years to all 58 BPS schools. With recently completed NY State Ed MSP funding dissemination is underway to all 7/8th grade science teachers and selected special-ed and technology teachers.
The request to New York State funding is guided by the structure of the Buffalo Public Schools budget sources. The Buffalo Public Schools budget is funded primarily by New York State, as one of New York’s “Big Five” school districts. The five city school districts with populations over 125,000 people are New York City, Yonkers, Rochester, Syracuse and Buffalo. The cities of the Big Five districts do not collect school taxes or millage funding, they are primarily funded by New York State through direct funding, programmatic grants and other support mechanisms, including pass through of federal Department of Education funding. For the Big 5 Districts, the local City municipal budget is expected to directly support the district budget. For Buffalo, in particular, State support, including pass through funding from federal sources, constitutes 83 percent of the 2015-2016 budget, with the City of Buffalo providing 8.3 percent, Erie County, through sales taxes, supporting 5 percent of the budget. Thus, working with New York State for primary funding of ISEP is consistent with the overall approach to sustainability, since NY State would have to approve funding components of BPS budget for ISEP in the longer term.

Within the first transition step is a complementary approach to the base New York State funding that includes targeted grant applications to NSF, the US Department of Education and private foundations combined with increased emphasis on funding and participation from additional corporate partners. Table 1.1 includes a list of potential NSF, US Department of Education and private foundation funding programs that are being pursued and/or targeted for applications in 2017/2018. Descriptions of innovative present and new ISEP components that would be funded by these programs are also provided. The ITEST application was funded in January 2017. Yellow highlighted rows indicate grant applications that have been submitted and are pending. The orange listing, to the Office of Naval Research, will be submitted in April 2018. Gray areas are those grant applications that were submitted and declined, but will be resubmitted in 2018. The planned work includes monthly organizational meetings in each potential NSF grant listed.

An early point of institutional commitment of UB is the integration of ISEP within a new “Community of Excellence” internally funded interdisciplinary research and education program at UB, in the “Genome, Environment and Microbiome (GEM)”. Profs Norma Nowak and Jennifer Surtees have integrated funding for ISEP summer teacher PD and grad student support into the GEM base budget supported by the UB Provost. A second major new Institute, “Research and Education in Energy, Environment and Water” (RENEW) has also been established and ISEP Director Gardella has been conversations with the Director of RENEW about a K-12 component to the outreach and public policy component of the research and education plan.

2. School Based Wrap-Around Support for Implementation in Year 6
   
a. Graduate and Service-Learning Undergraduate Students: Recruitment, Placement and Training
In year 6 of the program, support for the number of STEM Ph.D. graduate assistants decreased to 2 full time
grad assistants (two semesters) and one half time (one semester) to find a sustainable balance from funding.
Each graduate assistant committed to 16-20 hours/week with support from over 70 service learning students,
comprised of credit bearing course and internships for undergraduates. The graduate assistants in the schools
work with teachers, classes and the principal, and meet at Common Planning time to facilitate all teachers
participating in wrap around support, including science, technology, mathematics and special education.

The participation of undergraduates in service-learning continued from UB. This allowed for every school to be
staffed in-class and after-school with at up to four students. A list of all participants in classroom and after
school is provided in the management plan, Section 2. Additional undergraduates came from the UB Honors
College Colloquium service learning programs, where 20 undergraduates, under the direction of a TA who was a
former ISEP service learning student each provided 20 hours of service learning support in the schools.
Undergraduate students participated in extensive training through the UB service-learning course, which
included content on mentoring, K-12 urban education, introduction to the Buffalo Public Schools and other
topics. Research studies and evaluation results related to student involvement were significant in guiding
preparation for the student work.

b. In-Class and After School programs
With the placement of undergraduate students in schools, new opportunities were developed for in-class and
additional after-school programs were developed. After school program support was also offered to teachers
who participated in the Buffalo State College course and materials that resulted from the program were
presented and displayed at the Annual Science Summit.

c. Informal Science Activities
ISEP continued leadership and participation in the BPS STEM Experience

The STEM Experience was again announced by Mayor Byron Brown of the City of Buffalo at a press conference.
ISEP sponsored the Science Summit and Brain Week Tour and was involved in the planning of the other events.
In addition, BPS students participated in larger numbers at the annual Science Exploration Day at UB on March
16th, where 25 tours, presentations and lectures attract nearly 1200 middle and high school students,
sponsored by UB and NY NSTA chapter (STANYS).

On March 12th, the ISEP organized the 4th Annual ISEP Student Science Summit at core partner Buffalo Museum
of Science. Each ISEP school prepared a research team and displayed their projects. This year, the judging
ceremony was omitted from the event as several teachers felt that the ceremony was very time consuming in
nature. Also, participation was opened to BSC course teachers as well. Nearly 200 people came to the event,
including parents, teachers, students and community leadership.
In addition, ISEP partnered with a local not-for profit, HEAL International, for a college open house titled UB 360. The purpose of the event was to expose immigrant and refugee students to STEM careers and available academic options. Approximately 75 BPS immigrant/refugee students were able to participate in a laboratory experience for the first time.

Photos from the event can be accessed here: https://photos.app.goo.gl/UtJVsFKsV5yQTjwL2

d. Pilot of Community School Events at BPS
Community Schools are public schools that emphasize family engagement in addition to strong community partnerships so that it can improve the student learning experience. During the 2016-2017 school year, thirteen Buffalo Public Schools have been designated as community schools for learning events. This was possible because the Buffalo Public Schools have received funding from the Foundation Aid for Community Schools programs.

ISEP has been at the forefront as a community partner and piloted events during the school year. ISEP adopted a learning series model for the pilot and have titled it as “Serious About Science” or SAS.

On March 4th and April 22, ISEP hosted the “Serious About Science” events at South Park High School. Students from the Student Affiliates of the American Chemical Society (SAACS) and UB Chemical Engineering hosted workshops for parents and students to work on together.

In the upcoming year(s), ISEP would like to continue to be a strong partner of the Community Schools Initiative by coordinating STEM workshops hosted by university students.

e. Parent Partnership
Previously, ISEP had a strong partnership with the District Parent Coordinating Council (DPCC). In the 2016-2017 school year, ISEP established a working relationship with the Buffalo Parent Teacher Organization (BPTO).

The BPS Superintendent, Dr. Kriner Cash, appointed Dr. Ramona Reynolds as the Director of the Office of Parent and Family Engagement, and she helped build collaboration in Parent leadership. The structures of the parent groups have become a collective voice by the end of the school year. ISEP staff have participated and observed in individual parent meetings.

In previous years, ISEP Parent Engagement was through independent parent PLC’s. Due to the restructuring of district-wide parent engagement as well as the initiation of community schools, ISEP no longer hosts independent meetings. Instead, parents are invited to ISEP working meetings, and ISEP staff is also present at independent parent meetings that discuss a host of topics. This has allowed a free flow of exchange of ideas on multiple levels.

For example, when ISEP leadership meeting to discuss how higher education partners can stimulate workforce development, parents were invited to the table to provide their input. In addition, ISEP is invited at parent meetings to provide input to the dialogue. An example of this is that at both BPTO and DPCC meetings, parents have expressed that they would like to understand the science content more so that they can work with their children. In response, ISEP began piloting (and will continue to host) Serious About Science (SAS) programs during the Saturday Academy as well as “Science for Parents” at the Parent Center.

A true demarcation that ISEP has become a landmark for parents in regards to STEM is when parent leadership from both BPTO and DPCC have contacted ISEP to host the STEM segment during the annual parent summit.
ISEP was able to provide three different experiments in different sessions for approximately 90 parents and children.

Photos from the Parent Summit can be accessed here: https://photos.app.goo.gl/WPlb88Y7CY9XHVfC2

f. Workforce Development
A recurring theme in Buffalo is workforce development. ISEP is part of the continuum of conversations. While we have corporate partnerships with Praxair, we have endeavored to forge relationships with other manufacturers and smaller businesses.

This has lead to ISEP creating conversations with Buffalo Manufacturing Works (with help from our corporate partner Dr. Larry Megan) as well as conversations with the Buffalo Niagara Medical Campus/Innovation Center as well as the Foundry.

To pilot partnerships with small businesses and create a model, ISEP began working with Thimble.io, a small start-up that creates fun electronics that teach robotics and programming. Thimble works with Mr. Pat McQuaid at Bennett High School for the after-school program.

On a more expanded base in 2017, ISEP has introduced Thimble at a community school event with the possibility of creating a ten week program at a Saturday Academy to

g. Further development of a STEM/ENL initiative
ISEP continued the formal teacher PD based STEM/ENL program which enrolled 10 ESL teachers and 2 science teachers in 2014 increased to 14 ENL teachers in 2015 and decreased to 8 ENL teaches in 2016 (see Tables 1.3 and 1.5) working to develop translations of curriculum and pacing guides for 8th/9th grade Living Environment (NYS Regents Biology course) into languages of importance to Buffalo’s growing Immigrant/Refugee population, including oral and written translation into Arabic, Burmese, Somali and Bhutanese. These translations are found at https://www.joomag.com/en/newsstand/living-environment-translated/M0634930001412743925.

In 2015 and 2016 teachers developed Pictionary type materials and Visual Vocabularies that can support all ENL students regardless of English language proficiency. The purpose of the creation of the ENL Pictionary is to support and complement already completed SIOP (sheltered instruction observation protocol) lesson plans for co-taught Living Environment classes. It introduces, reviews and practices all Tier 1, 2 and some Tier 3 vocabulary words.

Many schools in NYS have adopted the learning language through content focus; thus many classes are co-taught by ESL and content teachers. ISEP was able to provide professional development support for ESL teachers who had limited training in STEM fields but can now work in coordination with their STEM field co-teacher.

The Pictionary type materials are not limited to usage by ESL students; they are also being utilized by students who are native English speakers because both tier I and tier II vocabulary are being presented. The Pictionary can be accessed here: https://drive.google.com/a/buffalo.edu/file/d/0B0C5Na0culGdcWdEbdGlsGyY7Qs5YXhlBhZsJVaE1INijV3WkpB/view?usp=sharing

In addition to direct STEM vocabulary building and direct translated resources, two of the ESL teachers have hosted STEM diversity workforce workshops at their school so that students are aware of STEM jobs and how to prepare for it.

h.
i. GIS Summer teacher and student camp
ISEP was awarded an ITEST grant in January 2017 to fund a GIS Summer teacher and student camp for three years, including aerial drone mapping and career counseling.

j. Development of an NSF INCLUDES Design and Development Pilot Application
ISEP submitted a preproposal in April 2016 and was selected to submit a full proposal in June of 2016. The proposal was declined, but has become a key portion of planning for potential sustainability of ISEP as a STEM Ecosystem. The program describes planning and potential pilot projects over two years, and focuses on expanding ISEP programs focused on increasing participation of female students and those from under-represented minority groups from Buffalo Public Schools and urban districts in Western New York. ISEP would collaborate and expand with higher education partners Jamestown Community College and SUNY Fredonia, along with the core ISEP Parent Professional Learning Community and Corporate Partners to study three key areas; transition from K-12 to college and career, expansion of informal and out of classroom partners building on connecting informal STEM learning experiences and methods to complement classroom work and focusing on the intersection of ENL activities to STEM learning. Cross cutting focus areas would include corporate participation and expansion of corporate partners and parent participation across all activities. The logic model for the proposed program is given below, in Figure 1.2

![Figure 1.2 Logic Model for Proposed WNY ISEP INCLUDES Design and Development Pilot](image)

k. Summary impact
The continued placement of graduate assistants, undergraduates and corporate partner staffing for wrap-around service support allowed the development of new opportunities and programs in-class and after school. Additional Informal Science activities in the evenings and in collaboration with the Buffalo Museum of Science were also made possible. These outcomes are partnership driven as UB, Buffalo State, the Museum of Science collaborated in planning with the BPS, as core partners, and supporting partners Praxair and WNY SLC have been engaged in recruitment of participants. Buffalo State faculty members have been engaged in training programs for the mentoring and in-school orientation. The work of these students allows for teacher implementation of challenging courses and curricula providing a means to overcome the limitations of large class sizes and limited funding to implement laboratory, field, inquiry based experimental work and new class content that aligns across middle and high school. Using evidence based design and outcomes is the basis for the wrap around support, but extensive research work focused on these students serves as the work of one of the science
education graduate assistants, Shaohui Chi and Yang Yang, directed by Professor Xiufeng Liu (Co-PI, head of the research team), the alignment of the ISEP program within other on-campus curricula at UB and Buffalo State, notably for the institutional work to expand service learning along with a serious plan to reach a goal of internal funding commitments from core partners to fund ISEP in the future contributes to both institutional change and sustainability. Thus, four of the five key features are central to this area of the ISEP program.

3. Summer Teacher Professional Development Year 5, Summer 2016 and Year 6, Summer 2017
   a. Interdisciplinary Research Placements and Results for Summer 2016

Table 1.2 shows the assignments, subjects and numbers of teachers summarized for each school for summer 2016. The organization of the teacher placements into these interdisciplinary subject “clusters” continued in 2016. (Table 1.3). Table 1.4 shows the listing of 14 teachers for 2017 with remaining funds.

These outcomes of the development teacher recruitment and placement are partnership driven as UB, Buffalo State and the BPS leadership collaborated in planning, as core partners, and supporting partners Praxair, Roswell Park Cancer Institute and Hauptman Woodward Research Institute have been engaged in aligning proposed ideas to placements in their laboratories. ISEP teacher professional development is responsive to the key theme of Teacher Quality, Quantity and Diversity. These major professional development opportunities, as aligned with school based themes may build loyalty and collaboration in the school. Examination of this hypothesis must be evaluated in ISEP. The work of the PD must allow for teacher implementation of challenging courses and curricula to implement laboratory, field, inquiry based experimental work and new class content that aligns across middle and high school. Using evidence based design and outcomes is the basis for professional development, but extensive research work focused on this planning is the work of the research team, directed by Professor Xiufeng Liu (coPI). His current work following ISEP teachers is discussed below. Finally, embedding and aligning the research opportunities within other on-campus curricula at UB and Buffalo State, contributes to both institutional change and sustainability. Thus, all five key features are central to this area of the ISEP program.

4. Professional Learning Communities (PLC’s)
Professional learning communities have been limited during the 2016-2017 academic school year to the following:

   a. **Parent/Guardian Based**: focusing on how to actively partner with your child to keep he/she engaged with ISEP and STEM.

The developmental goals of the ISEP Professional Learning Communities (PLCs) include a partnership driven structure designed to foster collaboration between all of the various ISEP partners. Building from the more traditional conceptions of PLCs (DuFour & Eaker, 1998, DuFour, Eaker and DuFour, 2005, Fullan 2001), ISEP has expanded the PLC to include additional participants. The primary role of PLC’s has been to cultivate mentoring partnerships between middle and high school teachers, additionally, to include parents and students; UB and BSC STEM and Education faculty; UB and BSC undergraduate and graduate students and volunteer STEM professionals. Thus, a clear understanding of parent involvement and parent participation was considered in PLCs, (along with other areas), following the Epstein models for parent participation (Epstein, 1986, 1987, 2001, 2006).

- **The ISEP Student Science Summit, March 12, 2016:**
The purpose of the ISEP Science Summit was to provide an opportunity for parents to see how ISEP was being implemented and to showcase ISEP teachers and students research. The event provides an excellent opportunity for parents, teachers, doctoral students, BPS students, BPS administrators and other community members to take pride in and acknowledge the immense amount work and effort the BPS teachers, UB graduate students and BPS students had dedicated to implementation and presentation of inquiry based science. Continuing to build on the work students and teachers had been doing in the classroom and in after school science clubs year’s Summit included more student participation as well as further development of research from prior year, resulting in more sophisticated topics and presentations.

There were approximately 200 attendees at the summit including: ISEP parents, grandparents and siblings; Buffalo Public School Administrators and ISEP building principals. Additionally, we invited summer program providers to the Summit to inform parents and students about potential summer STEM based opportunities for ISEP students.

All the students who participated where awarded certificates of recognition for their participation.

- Moving Forward
5. Research Report

The research team consists of Dr. Xiufeng Liu (team leader), ShaoHui Chi, and Yang Yang (doctoral student research assistants). During this past year, our research focus was continuing analysis of data we collected in previous years related to teacher professional learning communities in schools and teacher ISI pedagogical content knowledge development with its effect on student learning. The following products have been resulted in:

1. Conference Presentation:

2. Publications:

3. Completed Dissertation

Major Research Findings

1. Research on school professional learning community
ISEP Project Snow-ball Expansion
The following findings are based on a multi-year ethnography study in one of ISEP schools. The participants in this study were 20 teachers (three males and 17 females) at an Elementary (Pre-K-through grade 8) public school in one of the Northeastern states of the United States. These 20 teachers joined the ISEP project at different times during the period of 5 years when the ISEP project was in progress. Each of the 20 teachers was teaching students on one of the grade levels ranging from grade 4 to grade 8 at the same elementary school. At a later date, two teachers left for personal reasons. This research found that collaborative endeavors of the teachers’ team lead to increase in their students’ motivation and interest in learning processes as well as greater engagement of the schoolchildren, their parents, and community in Science-based educational events and activities. For readers’ convenience, in this report, ISEP participating teachers will be referred to as Beginners, if they have been in the ISEP project for one or two years, and Veterans, if they have worked with the ISEP from three to five years. Differences in perceptions by Beginners and Veterans might be explained by the fact that psychological effect of excitement and novelty might have subsided over time, giving the way to greater self-confidence and feeling accustomed to innovations and on-going changes, which might be perceived less challenging by Veteran participants due to their forming certain habits over duration of the ISEP grant.

We have collected about 184 minutes of teacher-interviews during the final phase in this project. Though the interviews were structured, the researcher often asked interviewees to clarify or further some of their ideas. So, the interviews often turned to be highly engaging professional conversations where teachers felt
free to show multiple sides of selves (e.g., educators, researchers, innovators, explorers, caring classroom teachers, and loving parents of their own children).

Though every particular teacher was distinctly unique by his or her nature, type of personality and temperament, many research participants expressed similar ideas. This fact attracted attention of the researcher team: many themes formed saliently traceable patterns.

For example, practically all teachers indicated that five years ago the ISEP partnership project was launched at their school by three enthusiastic educators. These “founding fathers” were the 8th grade Science teacher Rhonda Jackson, the 7th grade Science teacher John Smith, and the school media specialist Lillian Reed (all names used in this report are pseudo names). Rhonda, John, and Lillian joined the grand project hoping to “discover new horizons in teaching,” as they approached it. The three had no intention to facilitate spreading this initiative until they understood how beneficial it might be to both: school children and teachers.

Majority of interviewees stated that ISEP team began snowball-growing after the three initial participants started sharing their highly positive impressions about the opportunities this project had to offer to teachers and their students. According to the trio, the schoolteachers might benefit from entering the ISEP project via receiving such opportunities as continuous professional development, funding for extra-curricular activities, professional support from the participating college and university faculty members etc. The possible outcomes of participation in the ISEP project, as anticipated by the teachers, might include cognitive growth of school faculty members. Enrolling in the project, some teachers expected to acquire knowledge of the newest educational technologies and the latest methods, techniques, and approaches in teaching Science. The others aimed to further develop their researcher skills. While all of them hoped their students would benefit from receiving customized instruction, which would be tailored to suit modern children’s quest for technology-based learning. Many teachers realized that, regardless of great value of the information from the traditional school textbooks, reading per se is not sufficient for students as emergent researchers and scientists striving to the college. The teachers understood that what their students needed in order to succeed at school and get prepared for studies in college was up to date research-based information in multiple scientific fields and areas, and development of academic and researchers skills.

Upon receiving highly enthusiastic and encouraging remarks about the ISEP grant from the first three participants, the upper grade teachers decided to join in the team. As the new project appeared to work well with seventh and eighth graders, the growing team of ISEP participants promoted the new methods to the teachers in lower grades. In this way, by the second year of the grant, the team of the sixth grade teachers was welcomed aboard. In the following year, the project spread through all upper grades, starting at grade eight descending to grade five. By the last year of the grant, Ms Rhonda Jackson, the teachers’ team project-coordinator, involved the fourth grade team. By that time, the number of ISEP participating teachers reached 20. No one intended to leave the team.

During the interviews, practically every teacher mentioned that the “secret” of ISEP success in their school was directly connected to supportive attitude from the side of school administration. When questioned about the reasons standing behind the successful teamwork within the project, fifth grade teacher Lynn Adams explained, “Our principal is very supportive.”

This phrase recurred in practically every interview in response to the question about the relationship between Mary McLaughlin, this school’s principal and ISEP participating teachers. The fact that all of the interviewees granted their leader for success of their team, made obvious the role of skillful and thoughtful leadership. It was the type of leadership that did not target nor watch to penalize, but aimed to listen, collaborate, and support. According to the schoolteachers’ revelations, this was the weightiest factor.

Other questions for the researchers to ponder and investigate were, “What factors, in addition to high-skilled leadership, contributed to successful team work at Thompson Elementary school? What helped the teachers’ collaborative team to stay strongly bound? What factors helped the team avoid possible professional disintegration?”

According to the interview data, another powerful factor that greatly contributed to successful progress of the ISEP project in this particular school was the highly enthusiastic endeavor from the side of Ms Rhonda Jackson, the ISEP school coordinator. Similar ideas were expressed by the teachers in multiple interviews.

[21]
Rhonda is wonderful! Oh, Rhonda is fantastic! I mean she is the one that comes to us. She came to me and said, ‘Do you want to do this? I WANT you to do this! Get your team do this. We really enjoyed doing this.’ And Rhonda does a lot of stuff for us. I mean, whatever we need, she gets it for us. (Baker)

When asked to share her understanding of the nature of friendly and fruitful collaboration between the ISEP-participating team of teachers at this school, the project coordinator shed some light on this issue. Rhonda Jackson passionately explained,

I don’t think there is a teacher at our program that does not honestly believe that, no matter what’s going on, we got their back. I mean, in this building, we have all been together for quite a while... We just trust in each other. The administration trusts us. And our parents trust that we know better what is best for their kids. (Jackson)

The importance of mutual trust between the school community members was clearly noted by Rhonda Jackson. She obviously viewed it as a key-factor to this school team’s collaborative success. The fact that this theme recurred and could be heard in many other interviews by this school’s teachers confirmed the researchers’ guess about the significant role of developing strong professional inter-relationships within a team has the potential to contribute to maintaining good ideological and moral atmosphere in a school community. Just like in a natural symbiotic relationship, where all members do not only co-exist, but cooperate, and collaborate without anyone tending to dominate, over-power, overlive, or leave out the others. Teachers’ Perceptions of Benefits from the ISEP

According to the data from interviews, 91% of Beginners and 86% of Veterans expressed their appreciation of Interdisciplinary Science Inquiry approach. Same numeric ratio (91% against 86%) appears in participants’ reflections on the ISEP methods focused on teaching learning skills rather than requesting from students exact answers or the result of their work.

About 84% of all teachers highly appreciated hands-on teaching and learning approach promoted by the ISEP. 73% of Beginners and 86% of Veterans noticed higher motivation and engagement in their students due to technology-based teaching and learning methods they mastered during their Summer Institute studies. For example, Veteran participant John Smith pointed out significance of technology-based instruction to the modern days’ students, who he characterized as “digital native.”

John Smith shared,

I notice I am more willing to use some modern media. It does not necessarily fascinate me personally. But I can see where it gets the child’s attention. Even while it does not suit my personal learning style or teaching style, [laughs] if I can get to the kids, and get to pull across, that part is valuable. (Smith)

Intermediate grades teacher Ms Jane Allen expressed her fascination with the benefits of technology-based learning to students with special needs.

Ms Allen shared,

Watching how they flourish with the program and watching how they interact with code.org, and what they are doing really opened my eyes to. And even some of the low functioning students were really able to grasp it. It made me say, “These students might have harder times with the traditional curriculum in Science.” (Allen)

About 64% of Beginners and 43% of Veterans noticed increase in students’ interest in learning processes and activities. 64% of Beginners and 86% of Veterans noticed significant benefits to their students’ involvement and understanding content of classes after thematic out-of-school educational opportunities, content of which corresponded with the curriculum material taught in class. John Smith who sponsored the Rocket Club as one of the after-school extra-curricular ISEP-based activities, shared his impressions on the role of hands-on real-life learning for students’ engagement. As this teacher believed it is very important for students to see the practical results and implementation of the product of their joined work. This participant explained,
This year, we included an accelerated program with the software, which creates animation, graphic design and that kind of stuff, which is fascinating some of them [students]. We are planning next month or so to get into some of more robotic end of what we are doing. We are just trying to give them a new stepping-stone from the code.org, just learning the basic algorithm principles where they are trying to put it into the product. There is a product on the other end. (Smith)

Nearly 64% of Beginners and 43% of Veterans recognized advantages of students’ collaborative teamwork. About 44% of all teachers also noticed increase in self-confidence in their students in response to the ISEP teaching philosophy appropriated by schoolteachers. Susan Bailey pointed out noticeable difference between collaborative experiential and explorative classroom activities versus traditional text-book-based learning.

Ms Bailey explained,

For Science, textbooks have their place. And I think they are useful tools. But in a subject like Science, there are so many things that kids can do! I do not just think that this all needs to be textbook driven. (Bailey)

Due to PD opportunities offered by faculty members from colleges and universities, about 56% of all teachers felt academically and professionally supported, guided, and advised. 64% of Beginners and 43% of Veterans noticed their own professional and cognitive growth and reported the tendency to develop, explore, and implement new ideas of their own. When fourth grade teacher Mr. Steve Hall was questioned in what way his approach to teaching Science changed since he joined the project, this participant directly credited the influence from the ISEP team.

Mr. Hall shared,

It [approach to Science teaching] has changed because it has been in the circle of different professionals that engage in Science in different roles. It brought me to a different circle of people that I was not around before. And when you are in the circle of people who enjoy doing Science, you are engaged in different things and peer learning that I wasn’t around before. (Hall)

Among other advantages of the ISEP project, many teachers in both categories mentioned benefits to English as a New Language (ENL) speakers and special education students. Teachers appreciated greater access to new resources and noted lesser dependence on textbooks, due to greater employment of multimodality, including but not limited to technology, whiteboards, visuals, real life experiences, hands-on activities, after-school learning opportunities, and support by graduate project assistant and graduate student assistants. Teachers recognized multiple factors that contributed to effective progress of the ISEP grant project work at their school. As the major positive factor, 86% of Veterans and 64% of Beginners named long-time clustered supportive and collaborative practices of professional learning community (PLC) at their school, where the faculty members merged into one strongly interconnected entity, in which people trust, respect, and support each other. 82% of Beginners and 71% of Veterans found paired teaching and co-teaching highly beneficial for supporting students’ ability to focus on their studies. About 72% of all ISEP teachers found useful their co-planning practices in the form of on-going formal and informal communication.

Large percentage of all teachers recognized significance of skillful leadership of their school administrators and energetic input in the ISEP processes from teacher-project-coordinator. John Smith directly pointed the leading role of the school principal, Mrs. McLaughlin. He shared, “We were one of the first schools. That was because our principal bought in right away...Her commitment and belief in the system allowed us to take a great advantage of the grant in the program.”

Many teachers valued support from the graduate project assistant assigned to this school. Among other factors that contributed to successful progress of the ISEP project at this school, teachers named support from university and college faculty members, summer research and co-planning opportunities, availability of new resources from Summer Institute, and financial affordances of the grant. For example, Mr. Hall expressed his
high appreciation of the PD lead by university professors. He shared, “The team, and the professionals, and collaboration was wonderful! It was very interesting and very challenging.”

2. Research on Effects of ISEP on Teachers and Students
Four HLM models were applied to examine the relationships among factors of schools, teachers, and students. First, a two-level HLM was used to analyze relationships between factors at school and student level, then another two models were used to investigate relationships between factors of teachers and students, and between factors of schools and teachers. Finally, a three-level HLM was tested to see the relationships among the factors from all three levels.

Two-level HLM between factors of schools and teachers.
The sample in the analysis included 12 schools and 256 teachers. The fully unconditional model showed that around 9% of teacher PCK variance was between schools, which left 91% variance at the teacher level. The two variables in PD program only explained 7% of teacher level variance. Teachers who attended over half of the PLC sessions per year scored 6.88 percent higher than their peers on average. Two school level factors were added in Model III, though significant, they only explained 3% of the school level variance. Average science class size was negatively related to teacher PCK results, one more student in the class than average resulted in 0.86 percent lower of a teacher’s PCK results (Table 1). While the whole school student-teacher ratio was positively associated with PCK results. Teachers in schools with higher student-teacher ratio seemed to score better. Both Model II and Model III were significant.

Two-level HLM between factors of schools and students.
Overall, 11 schools and 3293 students involved in the analysis. The fully unconditional model (Table 2, Model I) illustrated a significant variance (9%) between schools ($u_0 = 2636.76, p < 0.001$). Among student level predictors (Table 2, Model II), student self-efficacy, understanding of NOS, inquiry activities, and parent expectation were positively related to student understanding of CCs ($B = 16.58, p < 0.1, B = 23.57, p < 0.01$, and $B = 12.74, p < 0.1$, and $B = 12.62, p < 0.05$, respectively), when race and grade were held constant. Students with one point higher than the grand mean in self-efficacy/NOS/inquiry activity/parent expectation scored 16.58/23.57/12.74/12.62 points higher in their understanding of CCs on average. Parent assistance in student science work negatively associated with the outcome ($B = -12.90, p < 0.05$). Students with one point higher than the grand mean in parent assistance scored 12.90 points lower in their understanding of CCs on average. The variables explained 12% of variance in outcome at student level. The analysis of deviance change indicated the necessity of Model II. After adding school level predictors of demographics (Table 22, Model III), the coefficients of student level variables kept stable. Among school variables, students in a school of 10% higher of attendance rate than the
average scored 57.08 points higher in understanding of CCs, while suspension rate and teacher-student ratio played a negative role. Students in a school of 10% higher in suspension rate and one more student in teacher-student ratio scored 29.06 and 21.92 points lower. The school level variables explained 71% (out of 8%) of school level variance in student understanding of CCs and the model was significant based on the deviance change.

Two-level HLM between factors of teachers and students.

Overall, 85 teachers and 2546 students involved in the analysis. The fully unconditional model (Table 3, Model I) illustrated a significant variance (19%) between teachers (\(u_0 = 7100.51, p < 0.001\)). Among student level predictors (Table 3, Model II), student self-efficacy, understanding of NOS, and parent expectation were positively related to student understanding of CCs (B = 21.98, p < 0.001, B = 14.33, p < 0.1, and B = 18.90, p < 0.001, respectively), when race and grade were held constant. Students with one point higher than the grand mean in self-efficacy/NOS/parent expectation scored 21.98/14.33/18.90 points higher in their understanding of CCs on average; parent assistance in student science work were negatively associated with the outcome (B = -11.81, p < 0.001). Students with one point higher than the grand mean in parent assistance scored 11.80 points lower in their understanding of CCs on average. The variables explained 12% of variance in outcome at student level.

After adding school level predictors of demographics (Table 3, Model III), the coefficients of student level variables kept stable. Two teacher level factors were significantly related to student understanding of CCs. Students whose teacher attended over half of the PLC per year seemed to be higher of 22.26 points on average than their peers while students whose teachers participated in 6 weeks summer placement scored 28.05 points higher on average than their peers. The variance at the teacher level was explained for 7%. However, Model II and Model III were all significant.

Three-level HLM among factors of schools, teachers, and students.
The results from this model were used to answer research question 2 (or 2 c): what are the relationships, if any, between PD intervention and student understanding of CCs when student, teacher, and school demographics are controlled?
The three-level HLM was built based on the results from previous two-level models and significant variables of research focus were selected from all three levels. Overall, 11 schools, 191 teachers, and 3353 students involved in the analysis. The fully unconditional model (Table 4, Model I) illustrated significant variances of student understanding of CCs among schools (7.5%) and teachers (12.5%), while the other 80% of variance remained in the student level.

In Model II, student understanding of NOS, inquiry activities, and parent expectation were positively related to student understanding of CCs (B = 29.80, p < 0.001, and B = 13.52, p < 0.05, and B = 18.06, p < 0.01, respectively), when race was controlled; whereas parent assistance in student science work was negatively associated with the outcome (B = -12.65, p < 0.01). The results were similar as shown in the previous two-level models. The variables explained 9% of variance in outcome at student level. The deviance statistics showed a significant decrease in Chi-square, which indicated the necessity of Model II.

Two variables of PD intervention were added in Model III. Attendance of PLC was not related to student understanding of CCs, but students whose teachers participated in 6 weeks of summer placement scored 47.02 higher than their peers. The variables explained 19% of teacher level variance (19%*12.5% = 2.4%, which was the overall variance of student understanding of CCs explained). Because of the tiny variance explained, Model III did not have a significant deviance change. Model IV included two more school level variables, suspension rate and teacher-student ratio. Both of them were negatively related to student understanding of CCs. When suspension rate was 10% more than the grand mean, the average score was 47.02 points lower. For student-teacher ratio, one more student than the grand mean ratio resulted in 18.19 points lower in the average scores. The two variables explained 79% of variance in school level, and an overall 7% of total variance in student understanding of CCs.

Multi-level path analysis.
The results from this model were used to answer the research question: how does PD intervention finally influence student understanding of CCs through both teacher and student level factors? Based on the framework proposed and results of HLM analyses, a two-level path analysis was conducted by using M-plus software. The sample contained 198 teachers and 5500 students. Teacher PCK results were not related to student level variables from previous HLM analyses, thus, the variable was excluded from the following analysis, and the corresponding paths in the theoretical model were not shown in the results. Nevertheless, most paths remained the same as they were shown in the theoretical model. Teacher level variables included inquiry instruction, dummy coded summer placement and monthly PLC session, and student level variables included student understanding of NOS, self-efficacy in science, experience in inquiry activities, parent assistance in science work, and parent expectation. The outcome was student understanding of CCs. All control variables that significantly related to the outcomes from previous analyses were not shown in the picture. The full path model with significant coefficients of each path in solid line is shown in Figure 1 and the four non-significant paths are shown in broken lines. The model fit was presented by Chi-square = 126.39 (df = 15, p < 0.001), RMSEA = .037, CFI/TLI = .973/.927, and SRMR (within/between) = .036/.071. The indices suggest a great fit between the data and the model according to the criteria proposed in previous literature, in which CFI/TLI should be larger than .900 and RMSEA/SRMR should be smaller than .080.
The intra-class correlations showed that 15% of variance of student understanding of CCs, 7% of variance of student self-efficacy, 7% of variance of student understanding of NOS, and 8% of student experience in inquiry activity were at teacher level. Furthermore, 6 weeks summer placement had a small effect on scores of inquiry instruction, and then the inquiry instruction positively associated with student understanding of NOS, self-efficacy, and experience in inquiry activities. One point higher in inquiry instruction resulted in 0.29, 0.51, and 0.57 points higher in these three variables, respectively. Furthermore, the relationships between student understanding of Crosscutting Concepts and the background predictors, which included parent expectation, parent assistance in science work, and race, were similar with previous HLM analyses. Inquiry instruction, student understanding of NOS, and self-efficacy in science were directly related to student understanding of CCs, with one point higher in these predictors, the scores increased by 57.16, 18.59, and 24.91 points respectively. No direct effect was found between student experience in inquiry activities and the outcome. However, a few mediation effects could be identified. First, the effect of inquiry instruction on student understanding of CCs could be mediated by student understanding of NOS and self-efficacy. Second, student experience in inquiry activities was also mediated by self-efficacy.

Summary of Results
First, teacher attendance of PLC session was a marginally significant predictor of PCK test scores when science class size and teacher-student ratio were controlled. In other words, participating more PLC sessions helped teachers improve their scores on the PCK test. However, the scores on the PCK test were not related to teacher practice of inquiry instruction in classrooms. Although marginally significant, the 6-week experience in summer research was the only variable related to inquiry teaching of teachers. Adequate experience in authentic science and engineering research helped teachers implement inquiry teaching in classrooms.

Second, attendance rate of the school was positively associate with student understanding of CCs, while suspension rate, and teacher-student ratio of the school were negatively related to student understanding of CCs. It meant that students from schools with low suspension rates, low teacher-to-student ratios, and high attendance rate were likely to achieve higher scores in understanding of CCs. Furthermore, students whose teachers attended PLC session frequently (over half of the sessions per semester) or participated in 6-week summer research scored significantly higher than their peers when teachers’ teaching experience and science degree were controlled. Teacher PCK test scores were not related to student understanding of CCs. In addition, the relationship between 6-week research experience and student understanding of CCs remained significant when other school and teacher variables were controlled. At the same time, student self-efficacy, understanding of NOS, experience in inquiry activity, parent expectation, and parent assistance were all significantly related to student understanding of CCs.
Third, the relationships between student understanding of CCs and the variables of teacher and student were revealed as follows: (1) teachers’ adequate experience in science and engineering research could help them use more inquiry teaching strategies, which was associated with higher student self-efficacy, understanding of NOS, and better experience of inquiry activities for students; (2) students with higher self-efficacy and deeper understanding of NOS were more likely to achieve higher scores in the understanding of CCs, while the effect of student experience in inquiry activities was fully mediated by student self-efficacy, which meant participating in more inquiry activities helped student build self-efficacy in science learning, and in turn improved their understanding of CCs; (3) parent expectation positively influenced student understanding of CCs, self-efficacy, and student understanding of NOS, while parent assistance seemed to negatively relate to student understanding of CCs only. Therefore, students whose parents held higher expectations for their science learning showed higher self-efficacy, a deeper understanding of NOS, and higher scores in understanding of CCs. The overall effects on the latter variable accumulated. However, parent assistance of science work at home directly and negatively predicted student understanding of CCs, but it did not predict student self-efficacy and understanding of NOS. However, the factor may have potential relationships with other student-level variables, which required further research.

**Unpublished Doctoral Dissertations**

Part 1, Activities and Findings, Appendix 1 ISEP activity at SUNY Buffalo State College 9/1/16 and 8/31/17

Funding related activity:
- New proposals: Noyce S&S in July 2017; INCLUDES May 2017
- Attended STEM Ecosystems Community of Practice in Denver CO 10/17-17/2016 (only person from BSC) and Tampa FL 5/24-25/2017 with Joe Zawicki (2 BSC ISEP participants)
- Presented to NYS Legislative Delegation requesting state funded instantiation of ISEP activity on March 10th.

Follow-up stipends to ISEP teachers from Summer 2016 course for enacting STEM projects in their classrooms: $3,000 of follow up honoraria to 13 Buffalo Public Schools STEM teachers

MacIsaac participated in ISEP YouTube video presented at NSTA; also contributed $4,000 to supporting that video from BSC subaward funds

Buffalo State Physics undergraduates Chrissy Colson and Ariadne Salerno volunteered to assist with S.Finn at PS59/Drew Science Magnet School for 2 afterschool science clubs: Solar Cars and Sea Perch tele-operated submarine in Spring 2017. BSC African American undergraduate engineering student Keziya Raleigh was also hired to help with ISEP activities including the ISEP Annual Poster Fair, Science Summit and WNY Physics Olympics.

Judged / participated in / coordinated BSC contributions to ISEP Annual Poster Presentation Fair 13 December 2016 @ Bennett HS. Working in teams, all teachers participating in the ISEP summer 2016 course PHY596 had posters presented at the Summit, and described recently initiated STEM innovations from their schools that were proposed during the summer course. Students did not attend this event. BSC did final layout and printing of these posters, including duplicate copies to all members of teachers teams.

Judged / participated in / coordinated BSC contributions to ISEP Science Summit in March 2017 at Buffalo Museum of Science. All teachers participating in the ISEP summer 2016 course PHY596 presented posters at the Summit, and several teachers brought teams of students presenting examples of student STEM project work from their schools that were proposed and developed during the summer course and enacted in the 2016-7 school year (Eg Y Russo Science club, etc).

Loaned various physics demonstration equipment (Bell Jar and vacuum pump, Van deGraaff generator) and purchased STEM teaching supplies (whiteboards and markers; solar car kits, SONAR rangers, carts and tracks and probeware) for BPS teachers.

Worked with Brad Gearhart on his ISEP HS physics Shadowgraph project and physics students making learning video project throughout year. This work was presented at multiple venues, including local, state and national (GA 2/17) AAPT meetings, Master Teachers workshops etc. We are still working on one publication on each project for The Physics Teacher. Appended find a list of presentations.

Participated in BPS/SUNY STEM Read Aloud week with Buffalo Public Library in March 2017.

Funded Mr Russel J. Lis for a Botanical Identification and Instructional walk-around for the camp staff of Cradle Beach Camp in Summer 2016. In Oct 2016, we also paid $3,300 for CB Camp Scholarships in summer 2016.

Presented on physics of magnets and simple machines for the BPS Superintendent’s Professional Development days for Middle School STEM teachers on Nov 16th; ISEP also supplied classroom sets of magnets for teachers attending this event.
A sixth year subcontract was negotiated to fund activities at the Buffalo Museum of Science, a core partner.

The Buffalo Museum of Science, provided support to the Charles R. Drew Science Magnet School through classroom team teaching and differentiated learning for students for all grades, pre-k through eight. Weekly afterschool programming supported sixth and seventh grade students from January 2016 through May 2015 culminating with participation in the regional Solar Sprint Competition. Two teams entered their designed and built solar cars this year. They were the only Buffalo Public Schools entered in the competition that was hosted at the Buffalo Museum of Science. Summer Enrichment Scholarships to the Museum’s weekly Discovery Camps was offered to over thirty students from #59 and #50 Annex.

Wrap around support was also offered to the Parent Professional Learning Community through 30 free Museum family memberships to the participating parents from all the ISEP schools. For the fourth year the Museum played host to the annual ISEP Student Summit in March, 2016. The Museum supports the Teacher Professional Development PLC hosting the monthly workshops and presenting informal science best practices.

### Goal 2: Increase science teacher quantity, quality, diversity, and retention in urban schools.

| Objective 2: Increase the total number of highly-qualified science teachers teaching in the participating schools; hence the diversity of the science teacher population will increase, as well as increased retention for participating science teachers in their urban teaching positions. | Activity 2a: School based Wrap Around Support: the introduction of STEM Ph.D. graduate assistants and undergraduate service learning students to support science, technology and special education teachers in twelve schools in the Buffalo City School District | • Partnership Driven,  
• Teacher Quality, Quantity & Diversity  
• Challenging Courses & Curricula  
• Evidence-Based Design & Outcomes  
• Institutional Change & Sustainability | ✓ |
| Engage teachers (with a focus on beginning and under-represented teachers) in professional development offerings. Provide support and resources in and after school. Engage teachers in PLC’S. | Activity 2b: Teacher Professional Development: development of school based focus areas for STEM education in each school, and recruitment and placement of teachers from all twelve schools in summer interdisciplinary research.  
Activity 2c: Providing teachers with interdisciplinary science inquiry pedagogical support through monthly professional development workshops | • Partnership Driven  
• Teacher Quality, Quantity & Diversity  
• Challenging Courses & Curricula  
• Evidence-Based Design & Outcomes  
• Institutional Change & Sustainability | ✔ |   |   |
| Activity 2c: PLC’s: Participating teachers will form and sustain professional learning communities with other teachers in their school and district. Utilizing mentoring models with help from university STEM faculty and graduate students; participants will utilize social media, blogs and hold regularly scheduled face to face meetings. | • Partnership Driven, • Teacher Quality, Quantity & Diversity • Challenging Courses & Curricula • Evidence-Based Design & Outcomes • Institutional Change & Sustainability | ✓ | ✔ | Teacher based PLC continued throughout 2014-15 school year. The PLC’s focused on ISI and pedagogical content knowledge. |
Goal 3: Develop and sustain professional learning communities in urban schools, based on mentoring models, using university STEM faculty and graduate students.

| Objective 3: The ISEP Professional Learning Communities are partnership driven and designed to foster collaboration. The ISEP combines novel mentoring approaches and expanded Professional Learning Communities (PLC’s) to build leadership and resources for improving science education in high needs/high potential urban schools. The objective of PLC will be to cultivate mentoring partnerships with middle and high school teachers and students; UB and BSC STEM and Education faculty; UB and BSC undergraduate and graduate students; volunteer STEM professionals; and parents. |
| Activity 3a: Face to face meetings, virtual communication platforms: blogs, electronic professional communications network. ISEP Partners provide access to their interdisciplinary research programs Parent PLC; DPCC will also help organize school-based parent participation; as well as focus groups that identify best practices for parent participation in science and engineering education. |
| Activity 3b: External project evaluators collected and analyzed data from parents in PLC in 2015 |
| • Partnership Driven, • Teacher Quality, Quantity & Diversity • Challenging Courses & Curricula • Evidence-Based Design & Outcomes • Institutional Change & Sustainability |
| ✔ |
| ✔ |
| Currently all PLC’s are being conducted face-to-face. Initial PLC Clusters were created and implemented. PLC Clusters created opportunities for teachers within school buildings to work together in groups and as a team for upcoming summer 2014 research and 2014-15 school year. ISEP Coordinating Teachers created collaborative opportunities between middle and high school teachers via the formation of topic based PLC clusters including a ESL environmental science and GIS. A Principal based PLC was also implemented this year, establishing opportunities for ISEP principals to collaborative and leverage resources. An ISEP corporate/research partner PLC was implemented this year. The focus of this PLC includes examining ways the corporate comminate can play a stronger role in creating sustainable models that yield greater impacts regarding their partnerships with the BPS and the higher education community. Graduate students created collaborative opportunities between middle and high school teachers and students Parent PLC created opportunities for parents to collaborate with STEM faculty and BPS teachers through the ISEP STEM Social Justice Conference the ISEP Student Science Summit and the ISEP Parent Retreat. |
## Goal 4: Extend interdisciplinary inquiry based science and engineering learning to high school

<table>
<thead>
<tr>
<th>Objective 4:</th>
<th>Activity 4a: Expansion of the roster of ISEP participating schools, to include more high schools.</th>
<th>Activity 4b: Informal science activities both in and out of class.</th>
<th>Activity 4c: ISEP offerings will also include summer enrichment and university research internships for BPS students starting in Summer 2013.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Students of participating middle school teachers will continue to experience interdisciplinary science inquiry learning in high school. Students of participating high school teachers will continue experiencing interdisciplinary science inquiry learning in high school and will achieve higher than other students.</td>
<td>Partnership Driven, Teacher Quality, Quantity &amp; Diversity, Challenging Courses &amp; Curricula, Evidence-Based Design &amp; Outcomes, Institutional Change &amp; Sustainability</td>
<td>Partnership Driven, Teacher Quality, Quantity &amp; Diversity, Challenging Courses &amp; Curricula, Evidence-Based Design &amp; Outcomes, Institutional Change &amp; Sustainability</td>
<td>Partnership Driven, Teacher Quality, Quantity &amp; Diversity, Challenging Courses &amp; Curricula, Evidence-Based Design &amp; Outcomes, Institutional Change &amp; Sustainability</td>
</tr>
</tbody>
</table>

Summer opportunities for ISEP middle and high school students during the summer of 2014 included a GIS camp at the UB working BPS teachers, UB doctor students, and faculty; a school based camp at MST organized by ISSEP doctoral students and ISEP coordinating teachers, a middle school camp at the Buffalo Museum of Science, a middle school camp at Cradle Beach; internship opportunities with UB Chemistry faculty for high school students, and a two week research camp at HWI.
<table>
<thead>
<tr>
<th>Objective 5: Students of participating teachers will continue to experience interdisciplinary science inquiry learning in elementary, middle and high school. Participating science teachers will maintain involvement and STEM faculty and students will be actively involved in activities improving k-12 science education; parents will become more involved in school-based in/after-school programs.</th>

Parent participated in a new initiative; The ISEP STEM Ecosystems retreat in January 2016; which focused on sustainability and possible expansion into additional BPS schools.
Section 2: Management Report

Interdisciplinary Science and Engineering Partnership (ISEP) with Buffalo Public Schools

Year 6: 2016 – 2017 No Cost Extension
Overview

Year 6, as in year 5 ISEP leadership focused on core activities to enhance wrap around support for implementation of teacher research projects as classroom activities in academic year 2016/2017. The ISEP management team, led by the PIs (Gardella, Liu, Wallace, MacIsaac and Baudo) were supported by Ms. Farhana Hasan and a commitment of support for this position through the no cost extension in year 6 was received from the Vice President for Research and Economic Development at the University at Buffalo. Part time support came again from Mrs. Melissa Hagen, handling budget, purchasing and personnel. The Executive Committee did not meet in whole as smaller planning groups were developed for a series of initiatives as part of the implementation of the sustainability plan.

Figure 2.1: ISEP: Current (2017) Organizational Chart

Core Partner Management and Coordination

Core partner participation in all activities has continued to follow the identifications described in Figure 1. In particular, leadership and faculty from UB and BSC worked together regularly on every aspect of higher education participation, regular meetings with the Buffalo Museum of Science leadership occurred to plan programs as described in the Strategic Plan. Core partner leadership communicates
effectively through the Project Manager Farhana Hasan as envisioned in the Strategic Plan. The Project Manager has created email lists for all categories of participants.

ISEP leadership has begun the next stage of the ISEP program’s relationship with Buffalo Public Schools, involving expanding access to ISEP teacher based projects and support to schools beyond the 12 schools planned for the 5 year MSP grant. Ms. Hasan established several PLCs in summer 2016, these meetings have created networks of parents, graduate assistants and coordinating teachers and initiated communication between BPS science leadership and principals on ISEP related topics. Her report details subject based PLC’s and the Parent PLC as part of the Activities and Findings, Part 1.

Important management activities were both expanded from years 1-5 and new activities were established, according to the strategic plan in year 6. Project Manager Farhana Hasan and input from the Parent Professional Learning Community, as discussed in the Activities and Findings.

Table 2.1 summarizes school leadership from year 6. Results of the school based theme development are discussed in Activities and Findings.

Collaboration with BPS

This year we had significant stability in leadership (after ten different people serving as Superintendent or Interim Superintendent since 2011). Dr. Kriner Cash has aggressively moved to reorganize and develop a strong academic plan with professional development of teachers as a central aspect. Many aspects of our parent involvement have been POSTIVELY affected by Dr. Cash’s leadership team. Dr. Ramona Reynolds, Director of the Office of Parent and Family Engagement worked closely with the BPS District Parent Coordinating Council (a supporting partner of ISEP) and the Buffalo Parent Teacher Organization (BPTO) to develop a consolidated parent participation policy in BPS. ISEP collaborates with both organizations to get input on our program and enhance parent participation in STEM education in BPS. Farhana Hasan, ISEP Project Manager regularly attended meetings of both organizations. The new agreement has made the collaboration easier.

Thankfully, ISEP Partnership collaboration between the BPS Science Department leadership and ISEP activities continues to be a major focus of Ms. Kelly Baudo, Supervisor of Science. Ms. Baudo continued her exceptional collaboration with ISEP by participating in all planning efforts, and served on the Executive Committee. She met with UB and Buffalo State ISEP leadership at every school-based meeting. Ms. Baudo is very active in the approval chain for all informal science activities such as field trips and other off campus activities. A process of consultation with the Science Department, and development of criteria for alignment of requests to learning goals and standards produced a clearer means for teachers to justify requests for ISEP funding in support of these activities.

Our funding from NY State Ed for MSP funding for a program to disseminate ISEP middle school interdisciplinary teacher projects to all 7/8th grade BPS science teachers, along with selected technology and special ed teachers continued in 2016 but was concluded. No state funding has been announced for continuing STEM support in NY.
As the primary point of contact for BPS leadership, and now coPI on the NSF grant, Ms. Baudo continues to be an important intellectual collaborator and remains the point person for all teacher selection processes and decision-making for summer research and in school activities in collaboration with principals.

A particular responsibility engaging Ms. Baudo along with Principals is ISEP school based leadership transitions. This year saw several major changes in coordinating teachers, the passing of Bruce Allen (Burgard High), the retirement of Susan Wade (after 45 years of teaching), the movement of Michelle Zimmerman to a middle school as part of a separation of MST’s middle school and high school components and the hiring of Pat McQuaid, formerly coordinating teacher at East High, by the new Computer Science program at Bennett High. Lorraine Academy School 72 lost coordinating teacher Reva Gilbert because of a medical leave, and when she returned to service, she was shifted to a different school. As usual there were a number of shifts of principals. As a reminder in our operational plan, School based coordinating teachers serve a 9 month paid academic year appointment on ISEP to serve the following responsibilities:

- Point of contact with ALL ISEP leadership (UB, BSC, BPS, Museum, Roswell, etc.)
- Primary oversight of graduate assistants and undergraduate service learning students; training, orientation, classroom placements.
- Coordination of all ISEP associated teachers in the building. Research design, courses, PD alignment with school based goals.
- Point person between principal, UB ISEP leadership and district (Kelly Baudo) on ISEP related research, in class support and professional development.
- Responsible to meet with other coordinating teachers in PLC.
- Distribute summer PD applications, recruit teachers to ISEP,
- Vet and help submit applications for equipment, supplies, field trips.
- Responsible for coordinating with fellow ISEP teachers and doctoral students:
  - after-school science program and or building based science night,
  - full participation in ISEP Student Science Summit, including collaborating with fellow ISEP teachers, doctoral students and other core partners on ISEP grant.

Coordinating teachers are paid a stipend and this stipend was reduced to an academic year stipend. Some coordinating teachers were supported separately for research based PD from either ISEP residual funds or as part of the ITEST funded GIS Camp, as noted in Section 1.

Supporting Partner Development

Supporting partners for research development, Praxair, hosted three teachers in Summer 2017. Roswell Park Cancer Institute and Thermo Life Technologies did not host teachers this past summer, pursuing other options for K-12 STEM support of BPS. Further, Roswell leadership has worked on developing cancer genetics and cancer biology classroom materials at three schools and directing these to one of the high schools as a themed program.
Coordination with supporting partners for program development, the Western New York Service Learning Coalition and the District Parent Coordinating Council (DPCC) has been excellent.

These outcomes of the Core Partner management and Supporting Partner Development are obviously **partnership driven**. Using **evidence based design and outcomes** as developed by the Joyce Epstein models of parent involvement, outlined in our ISEP proposal, guiding participation at all levels. Finally, effective collaborations contribute to both **institutional change and sustainability**.

Table 2.1 on the next two pages shows ISEP Schools, Research Themes, Coordinating Teachers & STEM Graduate and Undergraduates that support classroom and after school activities so that teachers may implement results of ISEP professional development. Only three graduate students were hired and were spread among all ISEP teachers/schools. Michael Gallisdorfer and Angelina Montes are veteran ISEP Gas who organized special projects at requests from teachers. Razie Fathi was hired as a Computer Science expert and splits time at several schools supporting CS initiatives of the teachers, other part time masters students provide specific classroom support in various engineering and chemistry areas. STEM undergraduates include those taking service learning classes (SL Student), advanced internship credit or pay for continuing work (Intern) or freshman Honors Students required to do service learning during spring Honors Colloquium (25 hours for each student during the semester). Riverside High, School 19, School 31 School 93 and were popular spots for students interested in working with refugee and immigrant ESL (now English as New Language) students in STEM classes and after school programs.

Section 3: Financial Report

Interdisciplinary Science and Engineering Partnership (ISEP) with Buffalo Public Schools

Year 6: 2016 – 2017 No Cost Extension
3.1 Status

Spreadsheet reconciliation (below) reflects approximately 20% of UB’s portion award was left at the end of the year six (August 31, 2017.) The calculations include a rebalancing of indirect costs related to actual expenditures of direct costs for years one through six. Actual Participant Support costs exceeded original projections, which resulted in a shift $119,927 of indirect costs to direct (participant support) costs. With the remaining funds available, UB is requesting an additional six month no cost extension through February 28, 2018.

In year six, UB’s partnership with the Buffalo Museum of Science (BMS) extended for an additional year. In line with the first five years, BMS requested an additional $29,759 of funding. At the end of year six, the subcontract funding for BMS was expended as anticipated. Miami University of Ohio (evaluation) also continued its subcontract partnership with UB in year six. In early 2017, Miami U financial services determined the budget was over forecasted by $55,000, which was returned to UB. The difference between the subcontract increase for BMS and decrease for Miami U totaled $25,241 and was allocated toward additional Participant Support costs. Miami U reflected an approximate subcontract balance of 4% at the end of year six. This is consistent with the level of support needed to complete final evaluation services in conjunction with UB’s requested final no cost extension period ending February 28, 2018.

We are requested and were approved for carry over through February 2018 for five major categories:

- Staff support
- Graduate student support
- Supplies

and within the yellow highlighted Participant Support Costs:

- Support for teachers, in the form of travel support
- Support for our student research programs, including stipend support for middle and high school students

3.2 Background related to shortfalls and justification for use of carryover to 2017-2018.

The reduction of UB’s administrative budget plus the net amount returned from a subcontracting partner, allowed for a sixth summer of teacher participation. As anticipated, and seen in year five, an increased number of teachers were supported by travel funding to present their ISEP research to national and regional conferences.

The remaining requested carryover budget outside of participant support costs is projected to be used toward completion of data collection and summarization using a minimal number of staff and graduate students.

Details of the expenditures are in the spreadsheet in categories utilized in the NSF budget. An additional table has been inserted to project the six-month NCE (Y7) budget.

**Notes:**

1: Amounts listed are a reflection of budget rebalancing amongst subcontracting partners and rebalanced indirect costs. See narrative for details.

2: Updated to reflect actual expenditures through 8/31/2016. Carry-over was projected at the time of the last report submission.

Introduction

Discovery Center for Evaluation, Research, and Professional Learning (Discovery Center, formerly Ohio’s Evaluation and Assessment Center for Mathematics and Science Education) is the project evaluator for the University at Buffalo/Buffalo Public Schools (UB/BPS) Interdisciplinary Science and Engineering Partnership (ISEP) project. The UB/BPS ISEP project is funded through a Mathematics and Science Partnership (MSP) grant from the National Science Foundation (NSF). Dr. Sarah Woodruff, Miami University, is the Principal Investigator for the evaluation, and Ms. Yue Li is the Senior Research Associate and Project Team Leader for the evaluation.

Project Description

The University at Buffalo, Buffalo Public Schools Interdisciplinary Science and Engineering Partnership project is a National Science Foundation Mathematics and Science Partnership project working to establish and sustain a comprehensive partnership that targets middle and high school science and technology, with a focus on strengthening teacher professional development (PD) during the critical transition from middle to high school. This project addresses the critical need (documented nationally and locally) for improved student learning in standard areas of science by enhancing science inquiry knowledge and skills, enabling the implementation of interdisciplinary inquiry-based science teaching across all content standards, and supporting the BPS vision for inquiry-based science and engineering curricula. The ISEP project has six major goals:

- **GOAL 1:** Improve middle school science teachers’ knowledge and skills related to science inquiry through interdisciplinary science research and engineering design with university STEM faculty.
- **GOAL 2:** Increase science teacher quantity, quality, diversity, and retention in urban schools.
- **GOAL 3:** Develop and sustain professional learning communities in urban schools, based on mentoring models, with help from university STEM faculty and graduate students.
- **GOAL 4:** Extend interdisciplinary inquiry based science and engineering learning to high school.
- **GOAL 5:** Improve student achievement in science, attitude toward science-technology-society, and interest in pursuing advanced science studies.
- **GOAL 6:** Improve collaboration in student learning among university, school, and parents.

In order to achieve these goals, UB in collaboration with the Buffalo Public Schools, Buffalo State College, and Buffalo Museum of Science are engaged in the following activities:

- Science and technology teacher professional development with a focus on science inquiry content and pedagogical content knowledge through interdisciplinary science and engineering research and workshops led by UB and BSC STEM faculty and students.
- School-based support for teacher implementation of interdisciplinary inquiry-based science instruction by UB STEM graduate students assigned to BPS classrooms and after-school and weekend science clubs designed to expand student inquiry learning opportunities. Additional support comes from service learning students from UB, BSC, and area colleges. ISEP offerings include summer enrichment and university research internships for BPS students.
- Expanded professional learning communities (PLC) with mentoring relationships among UB STEM faculty members, undergraduate and graduate students, and BPS students and parents.

Additionally, the project conducts research on the processes and conditions in which teachers develop interdisciplinary science inquiry knowledge; how this information may be translated into pedagogical content knowledge that ultimately improves students’ science learning; and how professional learning communities may support the development of this pedagogical content knowledge. The project also is studying the impact of associated activities on participating STEM graduate students.
Evaluation

The Discovery Center was contracted to conduct summative, external evaluation activities for the UB/BPS ISEP project. Overarching evaluation efforts focus on assessing progress towards project goals and monitoring project implementation at the project, school, and classroom levels. The Discovery Center works closely with the internal evaluation and research team, led by Dr. Xiufeng Liu, to provide formative feedback for project improvement.

The Discovery Center employs a mixed methods approach with both formative and summative data collection and analysis. The evaluation design utilizes a combination of pre/post, quasi-experimental, as well as causal comparative quantitative measures; and collects relevant qualitative and descriptive data on project participants, their students, and participating schools. The evaluator also utilizes data and findings provided by the internal evaluation team to create annual and final reports that synthesize findings from all measures. During project Year 6 (the no-cost-extension year), the evaluation collected and/or analyzed quantitative data from ISEP participating teachers, students of ISEP and comparison teachers, and UB STEM graduate and undergraduate students.

The external summative evaluation plan submitted with the project’s proposal to the NSF was last updated in June 2016 to ensure coordination of ISEP project activities, internal research/evaluation, and the external evaluation. This plan will continue to be modified in response to emerging needs or changes in project plans. Table 1 shows an updated timeline of annual evaluation activities.

During Year 6 of the project, the Discovery Center and ISEP Project Team communicated via email, conference calls, and face-to-face meetings to discuss the progress of the evaluation and project. External evaluation activities conducted this year include: (a) researching/testing evaluation instruments; (b) administering online instruments for teacher participants and UB STEM students; (c) administering paper instruments for student participants; (d) collecting school-level demographic data; (e) analyzing data from project instruments; (f) preparing and submitting the Year 6 annual evaluation report; and (g) contributing to sustainability planning and related activities.

Evaluation of UB/BPS ISEP
Participants

Participants in the evaluation of the ISEP project include Buffalo Public School, elementary, middle, and high school teachers from the 12 participating ISEP schools, their students in Grades 4 through 12, as well as University at Buffalo and Buffalo State College STEM faculty, undergraduate students, and graduate students. Other key informants include BPS district and building administrators, ISEP project personnel, corporate partner teacher mentors, and non-participating BPS elementary, middle, and high school teachers.

Instrument, Data Collection, and Data Analysis

School-Level Enrollment and Report Card Data

In Spring 2017, the evaluation team collected school-level enrollment and report card data for each of the 12 ISEP partner schools for the 2015-2016 school years in the same manner as previous years in order to follow the project’s progress toward its goals.

Descriptive statistics (e.g., frequencies and percentages) were used to report year-to-year changes between baseline (2010-2011) and the most up-to-date school-level data (2015-2016).

UB/BPS ISEP Teacher Questionnaire (Summer 2016)

The UB/BPS ISEP Teacher Questionnaire was developed with permission from instruments previously used in NSF and USDOE MSP projects and in DRK12 projects. The Summer 2016 teacher questionnaire is composed of 7 sections, total of 218 items, for both teacher groups. The Demographic section contained 34 items asking for comprehensive demographics, including teachers’ professional development history. Items in this section were modified with permission from RMC Research (2009). The remaining 6 sections were exactly the same as the Summer 2015 version, which included items asking teachers’ mathematics preparation, science preparation, understanding of scientific inquiry and the nature of science, design engineering and technology, attitudes and beliefs about teaching science, and their knowledge, value, and practice of Common Core State Standards (CCSS) for ELA-literacy in science teaching.

A full description of this instrument, factor analysis, and reliability results can be found in the Evaluation of University at Buffalo/UB Interdisciplinary Science and Engineering Partnership: Annual Report 2012-2013 (Woodruff & Li, 2013) and in the Evaluation of University at

---

Evaluation of UB/BPS ISEP
In Summer 2016, the UB/BPS ISEP Teacher Questionnaire was administered by Discovery Center using Qualtrics® to collect data from two groups of teachers: 1) teachers who had participated in ISEP since Summer 2012, Summer 2013, Summer 2014, or Summer 2015, and 2) teachers who began participating in ISEP in Summer 2016 and completed the questionnaire before their participation in project activities. Summer 2016 Teacher Questionnaire data serves as post-questionnaire data for the first group and as pre-questionnaire data for the second group. The link to the instrument was sent to the teacher groups participating in the ISEP summer institute on June 28, 2016, and the questionnaires remained active online until July 29, 2016. Of the 145 teachers who participated in Summer 2012, Summer 2013, Summer 2014, Summer 2015, and/or Summer 2016 PD activities, 54 responded to this questionnaire (48 returning teachers and 6 new to ISEP in Summer 2016). The response rate was 37%.

Table 2 shows the number of teachers who responded to the Teacher Questionnaire each year, as well as their ISEP starting date. Of the 57 teachers who started ISEP in Summer 2012, two never responded to the Teacher Questionnaire in any of the 5 summers between 2012 and 2016; of the 30 teachers who started in Summer 2013, 19 teacher never responded to the questionnaire; of the 34 teachers who started in Summer 2014, 11 never responded to the questionnaire; of the 34 teachers who started in Summer 2015, 4 never responded the questionnaire in either Summer 2015 or Summer 2016. All new participants in Summer 2016 responded to the questionnaire. Together, 125 ISEP teachers have responded to the questionnaire at least once, with 224 data entries collected from Summer 2012 to Summer 2016. In order to capture project impact using the largest number of teacher responses, paired-samples t-test were conducted to compare Baseline-Post Year1, Baseline-Post Year 2, Baseline-Post Year 3, or Baseline-Post Year 4 teacher responses.

UB/BPS ISEP Teacher Pedagogical Content Assessment (PCK) Assessment (Summer 2013 to Summer 2016)

The ISEP research team used the following 6 instruments to collect pre and post data on teacher pedagogical content knowledge and knowledge of interdisciplinary science inquiry teaching: ²

- **Elementary School Pedagogical Content Knowledge (PCK) Assessment (General Science)** consists of 8 multiple-choice questions regarding classroom science teaching vignettes and 4 open-ended questions about Interdisciplinary Science Inquiry teaching. It was developed by the ISEP research team and the evaluation team using a modified version of Schuster and Cobern’s POSTT,³ with permission, based on input from in-service teachers, results of observations of teaching, and science curriculum standards.

- **Middle School PCK Assessment (General Science)** consists of 8 multiple-choice questions regarding classroom science teaching vignettes and 4 open-ended questions about Interdisciplinary Science Inquiry teaching. It was developed by the ISEP research team and the evaluation team using a modified version of Schuster and Cobern’s POSTT, with permission. It was based on input from in-service teachers, results of observations of teaching, and science curriculum standards.

- **Biology PCK Assessment** consists of 29 multiple-choice items from ATLAST Flow of Matter and Energy⁴ and 4 open-ended questions about Interdisciplinary Science Inquiry teaching developed by the ISEP research team.

- **Chemistry PCK Assessment** consists of 30 items from AIM Teacher Assessment Form M4: Properties of and Changes in Matter and 4 open-ended questions about Interdisciplinary Science Inquiry teaching developed by the ISEP research team.⁵

- **Earth Science PCK Assessment** consists of 30 items from ATLAST Plate Tectonics⁶ and 4 open-ended questions about Interdisciplinary Science Inquiry teaching developed by the ISEP research team.

- **Engineering & Physics PCK Assessment** consists of 29 items from ATLAST Force and Motion⁷ and 4 open-ended questions about Interdisciplinary Science Inquiry teaching developed by the ISEP research team.

---

² The Biology, Chemistry, Earth Science, Engineering/Physics, and Physics PCK Assessments were used, with permission, from the Assessing Teacher Learning About Science Teaching (ATLAST) project at Horizon Research, Inc. ATLAST is funded by the National Science Foundation under grant number DUE-0335328.

All instruments used or modified for use in the ISEP project were used with permission.

The UB/BPS ISEP Teacher PCK Assessment instruments were administered in hard copy by the ISEP research team to teachers in Summer 2016. Responses from returning teachers were considered as post assessment for their Summer 2013, Summer 2014, and/or Summer 2015 responses.

Table 3 shows the number of responses received in each year. Findings of Biology, Chemistry, Earth Science, and Engineering/Physics assessments using the Summer 2013, Summer 2014, Summer 2015, and Summer 2016 data will be reported by the ISEP research team. Data from the Elementary and Middle School Science Teacher PCK Assessments are closely related to teachers’ teaching practices aligned with inquiry. Therefore, pre-post changes using data from these two instruments will be reported by the external evaluation team in this report.

The evaluators considered choices for each item on both assessments scored on a continuum from the most teacher-directed PCK practices (1) to the most student-directed PCK practices (4). In this way, changes in teacher responses can be represented as shifting from teacher-directed practices to student-directed practices over time. Descriptive analysis was conducted to examine trend of teachers’ PCK scores by the number of years of participation in ISEP.

UB/BPS ISEP Student Questionnaire (Spring 2016 and Fall 2016)

The UB/BPS ISEP Student Questionnaire was developed by the Discovery Center with input from the ISEP Research Team from instruments previously used in NSF as well as USDOE MSP and DRK12 projects evaluated by the Discovery Center. This questionnaire collected data from elementary, middle, and high school students of ISEP participant and comparison teachers in Fall 2015 (pre for 2015-2016), Spring 2016 (post for 2015-2016), and Fall 2016 (pre for 2016-2017). This instrument has two versions, one for elementary and middle school students (Grades 5-8, ES/MS) and the other for high school students (Grades 9-12, HS). A full description of this instrument, factor analysis, and reliability results can be found in the Evaluation of University at Buffalo/Buffalo Public Schools (UB/BPS) Interdisciplinary Science and Engineering Partnership: Annual Report 2013-2014 (Woodruff & Li, 2014). Table 4 shows the internal consistency reliability results for Fall 2015 and Spring 2016 data. Overall, Cronbach’s alpha values showed that the four attitudinal subscales had high reliabilities and the elementary/middle school content knowledge assessments were moderately reliable. The high school content knowledge assessment showed low reliability using data from Fall 2015 and high reliability using Spring 2016 data.

Hard copies of the UB/BPS ISEP Student Questionnaire were administered to students of ISEP participant and comparison teachers, at the 12 ISEP partner schools, in Fall 2015, Spring 2016, and Fall 2016. Fall 2015 data served as pre-data for the 2015-2016 school year; Spring 2016 data served as post-data for the 2015-2016 school year. Fall 2016 data will only be used in the dosage-effect analysis in the final report. Of the 87 teachers who received this instrument (68 ISEP and 19 comparison teachers) in Fall 2015, 47 returned completed student instruments (47 ISEP and 6 comparison teachers, *n* = 944). Of the 87 teachers who received this instrument (68 ISEP and 19 comparison teachers) in Spring 2016, 33 returned completed student instruments (32 ISEP and 1 comparison teachers, *n* = 629). Of the 63 teachers who received this instrument (49 ISEP and 14 comparison teachers) in Fall 2016, 13 returned completed student instruments (11 ISEP and 2 comparison teachers, *n* = 295). The response rates were 54% in Fall 2015, 38% in Spring 2016, and 21% in Fall 2016, based on the number of teachers who were contacted.

Ideally, ANOVA analysis should be conducted for comparison of post-responses of students of ISEP participant teachers and comparison teachers, using students’ pre-responses as a covariate variable to control initial perception differences. However, only one comparison teacher returned both pre- to post- student questionnaires during the school year, which did not allow ANOVA tests between ISEP and comparison groups. Instead, independent-samples *t*-tests were conducted to compare students’ responses to the UB/BPS ISEP Student Questionnaire before (Fall 2015) and after (Spring 2016) their teachers’ participation in ISEP activities for elementary, middle, and high school, separately. All analyses of student questionnaire data were conducted at the item level.

**UB/BPS ISEP STEM Student Questionnaire (Fall 2016)**

The UB/BPS ISEP STEM Student Questionnaire collected data from UB STEM graduate and undergraduate students who participated in project activities in Fall 2016. The instrument was developed by Dr. Liu, internal evaluator and researcher for the ISEP project, and was administered online to new and returning UB STEM students by the Discovery Center at the end of each semester using Qualtrics®.

Section A contains 1 multiple-choice item asking about students’ preparedness for aspects of project activities in schools. Section B contains 1 multiple-choice item asking about students’ self-reported experiences in schools. Section C contains 1 multiple-choice item, 14 items on a 4-point Likert-type scale, with responses ranging from *strongly disagree* (1) to *strongly agree* (4), and four items on a 5-point Likert-type scale, with responses ranging from *strongly decreased* (1) to *strongly increased* (5), asking about students’ perceived value of project experiences. Section D contains 20 items on a 5-point rating scale, with responses ranging from *nothing* (1) to *a great deal* (5), asking about students’ self-efficacy in
communicating science. Section E contains 8 items requesting students’ comprehensive demographics, experiential history, and career plan data.

The *UB/BPS ISEP STEM Student Questionnaire* was administered online by the Discovery Center to new and returning UB STEM students at the end of Fall 2016 using Qualtrics®. Thirteen STEM students completed this questionnaire. Response rate is 50%.

Descriptive statistics (e.g., frequencies and percentages) were used to report findings from the *UB/BPS ISEP STEM Student Questionnaire* data. Independent-samples *t*-tests were used to conduct comparisons at the item level between the responses of STEM undergraduate and STEM graduate students and between the responses of STEM graduate students who participated in the ISEP project for more than 1 year and those who were new to the project.
Findings

School-Level Enrollment and Report Card Data (2010-2011 to 2015-2016)

School-level data were collected and analyzed to compare aggregate teacher information, student demographics, and middle/high school student performance data for each ISEP partner school from 2010-2011 to 2015-2016. Data in 2012-2013, 2013-2014, 2014-2015, and 2015-2016 correspond to the first 4 ISEP project years.

Since aggregated information exclusively for science teachers is not available on the New York State School Report Card or other publicly available data sources, information was reported for all teachers in the building. From 2010-2011 to 2015-2016, the percentage of teachers teaching without an appropriate license/certificate decreased at 2 of the 12 ISEP partner schools; the percentage of teachers with a Master’s plus 30 hours or doctorate degree increased at 9 schools; and the percentage of core courses not taught by highly qualified teachers decreased at 3 schools. The turnover rates from 2014-2015 school year to 2015-2016 school year for teachers with fewer than 5 years of experience and for all teachers were not available at the school level (Appendix A, Table A1).

Between 2010-2011 and 2015-2016, the percentage of White students decreased across the state of New York, across the BPS District, and at 6 ISEP partner high schools and 2 K-8 schools. The percentage of students eligible for free or reduced lunch increased at the state level, decreased at the district level, and decreased at 11 of the 12 ISEP partner schools, although all ISEP partner schools had much higher percentages of students who receive free or reduced lunch than the state average. The percentage of students with Limited English Proficiency (LEP) remained the same at the state level, increased at the district level and in 11 of the 12 ISEP partner schools (Appendix A, Tables A2 and A3).

Between 2010-2011 and 2015-2016, high school graduation rates increased at the state level, district level, and 2 of the 7 ISEP partner high schools. Six high schools had graduation rates lower than the BPS District average and only 1 was higher than the district and the New York State averages in 2015-2016. There were no obvious patterns of change regarding graduation rates for students in racial/ethnic or gender subgroups (Appendix A, Table A3).

No obvious patterns were found regarding the percentage of students meeting or exceeding New York State Standards in Grade 8 Science, Regents Earth Science, and/or Regents Chemistry between 2010-2011 and 2015-2016 (Appendix A, Tables A2 and A3).

UB/BPS ISEP Teacher Questionnaire Data, Summer 2012 to Summer 2016

Paired-samples t-tests were conducted to compare ISEP participant teachers’ perception changes from Pre to Post Year 1, from Pre to Post Year 2, from Pre to Post Year 3, and from Pre to Post Year 4.

Science Preparation and Professional Development Needs

Table 5 shows ISEP teachers’ self-reported preparedness for science instruction. Compared to their baseline responses, teachers indicated that they were significantly better prepared to teach science to students from a variety of cultural backgrounds, to encourage participation of females and minorities in science courses, to use a variety of technological tools to enhance student learning, and to teach interdisciplinary science inquiry following one year of ISEP participation. Teachers’ preparedness for science instruction has been sustained over the project years. Specifically, teachers reported that they were significantly better prepared to lead students using investigative strategies and to teach
interdisciplinary science inquiry following four years of ISEP participation, compared to their baseline responses.

*p < .05, ** p < .01, *** p < .001.
p values were calculated based on paired-samples t-tests.
Mean differences were calculated using pre mean scores minus post mean scores.
Absolute values larger than one-quarter of a point were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

Table 6 shows teachers’ needs for professional development prior to and following participation in the ISEP project. Before participating in ISEP activities, teachers indicated higher priority professional development needs related to aspects of science teaching closely aligned with NGSS cross-cutting concepts (i.e., scale, proportion, and quantity; systems and system models; and energy and matter) as well as some aspects of inquiry teaching (i.e., helping students develop the ability to communicate with others an argument based on evidence) than they did following one or more years of participation in ISEP. On the other hand, teachers reported higher priority professional development needs related to some aspects of inquiry teaching (i.e., the ability to develop and use valid models and to ask questions and define problems, and the ability to obtain, evaluate, and communicate information) after their participation.

*p < .05, **p < .01, ***p < .001.

P values were calculated based on paired-samples t-tests.

Mean differences were calculated using pre mean scores minus post mean scores.

Absolute values larger than one-quarter of a point were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

Science as Inquiry & Understanding the Nature of Science

Table 7 shows teachers’ views of inquiry-based science teaching and learning practices before and after ISEP participation. Compared to their baseline responses, teachers reported that they were able to better clarify some of the misunderstanding of scientific inquiry. For example, following three years of ISEP participation, teachers reported less agreement with the statements that inquiry-based learners first understand basic, key science concepts prior to engaging in inquiry activities and that inquiry-based learning requires learners to engage in hands-on activities.

Although not statistically significant, compared to their baseline responses, teachers reported less agreement with accurate understandings of the teacher’s role in inquiry-based teaching following 3 or 4 years of ISEP participation (i.e., inquiry-based teaching requires that the teacher act as a facilitator or guide of student learning, inquiry-based teaching focuses more on what the students do, and inquiry-based teaching requires that the teacher have a strong background in the science content related to the inquiry).

</table>

*p* < .05, **p** < .01, ***p*** < .001.

*p* values were calculated based on paired-samples *t*-tests. Mean differences were calculated using pre mean scores minus post mean scores. Absolute values larger than one-quarter of a point were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

Table 8 shows data regarding teachers’ understanding of the nature of science. Although not statistically significant, following 1 year of participation in ISEP activities, teacher participants agreed more with the accurate understandings that scientific knowledge is reliable and durable so having confidence in scientific knowledge is reasonable; and scientific laws are generalizations or universal relationships about some aspect of the natural world and how it behaves under certain conditions.

Following 2 years of ISEP participation, teachers reported mixed perceptual changes, demonstrating both fewer misconceptions and fewer accurate understandings of the nature of science. Compared to their baseline responses, teachers agreed less that a universal step-by-step scientific method is used by all scientists and scientific experiments are the only means used to develop scientific knowledge; but also agreed less with accurate statements, including that with new evidence and/or interpretation, existing scientific ideas are replaced or supplemented by newer ones; scientific theories are inferred explanations of some aspect of the natural world; scientific conclusions are to some extent influenced by the social and cultural context of the researcher; and scientific observations are to some extent influenced by the observer’s experiences and expectations.

Following 4 years of ISEP participation, teachers started to report more positive changes regarding their understanding of the nature of science. For example, after participation in ISEP for 4 years, teachers agreed significantly less that cultural values and expectations do not influence scientific research because scientists are trained to conduct unbiased studies and that scientists do not use their imagination and creativity because these can interfere with objectivity. Although not statistically significant, teachers also reported more agreement with statements, including that scientific knowledge is reliable and durable so having confidence in scientific knowledge is reasonable; with new evidence and/or interpretation, existing scientific ideas are replaced or supplemented by newer ones; the principal product of science is conceptual knowledge about and explanations of the natural world; scientific theories are inferred explanations of some aspect of the natural world; scientific conclusions are to some extent influenced by the social and cultural context of the researcher; and scientific observations are to some extent influenced by the observer’s experiences and expectations.

**Design, Engineering, and Technology (DET)**

ISEP teachers were asked a number of questions about their familiarity with, beliefs about teaching, and barriers to teaching topics related to design, engineering, and technology prior to and following their participation in ISEP professional development. As shown in Table 9, following one or more years of ISEP participation, teachers reported using more DET activities in classrooms and having more school support for using DET activities.

* p < .05, ** p < .01, *** p < .001.

$p$ values were calculated based on paired-samples $t$-tests.
Mean differences were calculated using pre mean scores minus post mean scores.
Absolute values larger than one-quarter of a point were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

Attitudes and Beliefs about Teaching Science

Tables 10 shows changes in teachers’ attitudes and beliefs about teaching science following ISEP participation. Following ISEP participation, teachers reported more agreement that students should have opportunities to experience manipulating materials in the science classroom before teachers introduce scientific vocabulary and less agreement that they were scared by the idea of teaching engineering design concepts.

Pedagogical Content Knowledge (PCK) Assessment

Table 11 shows teachers’ responses to the PCK assessment by their length of participation in ISEP for each subject area. Figure 1 shows teachers’ PCK scores by their response year. Overall, no observable patterns of change in scores are shown as teachers participated in ISEP for a longer period.

**UB/BPS ISEP Student Questionnaire Data, Fall 2015 – Spring 2016**

**Demographics**

In Fall 2015 and Spring 2016, 944 and 629 students responded to the *UB/BPS ISEP Student Questionnaire*, respectively. Among them, 795 students in Fall 2015 and 607 students in Spring 2016 were taught by ISEP teachers, while 149 students in Fall 2015 and 22 students in Spring 2016 were taught by teachers who were not involved in ISEP, but who also taught in the 12 partner schools. Since a very small number of ISEP students and an even smaller number of comparison student could be matched from Fall 2015 to Spring 2016, independent t-test comparisons were conducted using unmatched samples to examine the ISEP students’ changes in their attitudes and content knowledge from Fall 2015 to Spring 2016. Table 12 shows ISEP and comparison students’ grade levels.

* Respondents reported ethnicity, but did not report race.
Elementary Grades Students’ Attitudes and Perceptions about Science Learning

When comparing pre-post attitudes and opinions of elementary grades students of ISEP participant teachers, students agreed significantly more that science ideas or hypotheses must be supported by evidence; they learned that there are different solutions to science tasks; they used multiple sources of information to learn; they learned about how science is important in the real world, and they worked on science tasks in a group with other students in Spring 2016 than they did in Fall 2015. They also reported receiving more parental support at home with their science homework and projects (Table 15).

Note. Q8: 1 = Strongly Disagree, 5 = Strongly Agree; and Q9, Q10, & Q11: 1 = Almost Never, 5 = Very Often. p-values were calculated based on independent-samples t-tests. p-values less or equal to 0.05 were yellow highlighted and bolded.

Mean differences were calculated using Fall 2015 mean scores minus Spring 2016 mean scores. Absolute values larger than one-quarter of a point were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

**Middle Grades Students’ Attitudes and Perceptions about Science Learning**

When comparing pre-post attitudes and opinions of middle school students of ISEP participant teachers, students agreed significantly more that almost all people use science in their jobs; scientific theories can change when new evidence or a new explanation becomes available; they use information and data to support their conclusions; and they worked on science tasks in a group with other students in Spring 2016 than they did in Fall 2015 (Table 16).

### High School Grades Students’ Attitudes and Perceptions about Science Learning

When comparing pre-post attitudes and opinions of high school students of ISEP participant teachers, students agreed significantly more that they talked with other students about how to do a science task or about how to interpret the data from an experiment; learned from other students; considered different scientific explanations; had a say in deciding what activities they do; used a computer or the Internet for science assignments or activities; wrote about how they solved a science task or about what they were learning; learned that there were different solutions to science tasks, and used multiple sources of information to learn in their science classes in Spring 2016 than they did in Fall 2015 (Table 17). High school ISEP students reported greater likelihood to major in an engineering, science, or engineering technical field in college at the end of the 2015-2016 school year.

**Note.** Q8: 1 = Strongly Disagree, 5 = Strongly Agree; and Q9, Q10, & Q11: 1 = Almost Never, 5 = Very Often.  
p-values were calculated based on independent-samples t-tests. p-values less or equal to 0.05 were yellow highlighted and bolded.  
Mean differences were calculated using Fall 2015 mean scores minus Spring 2016 mean scores. Significant mean differences were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

### Elementary, Middle, and High School Students’ Content Knowledge Assessment

Using the unmatched sample, ISEP elementary school students’ content knowledge assessment scores improved significantly on 10 of the 20 items as well as for overall assessment score from Fall 2015 to Spring 2016 (Table 18).

**Table 18. Comparisons of ISEP Students’ Pre-Post Content Knowledge Assessment, UB/BPS ISEP Student Questionnaire, Fall 2015 and Spring 2016, Elementary School Students, Unmatched**

$p$ values were calculated based on independent-samples $t$-tests. $p$-values less or equal to 0.05 were yellow highlighted and bolded. Mean differences were calculated using Fall 2015 mean scores minus Spring 2016 mean scores. Significant mean differences were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.

Using the unmatched sample, ISEP middle school students’ content knowledge scores improved significantly on 1 item from Fall 2015 to Spring 2016 (Table 19). Although not statistically significant, middle school students also scored slightly better on 16 other items and for the overall assessment score at the end of the school year.

- *p* values were calculated based on independent-samples *t*-tests. *p*-values less or equal to 0.05 were yellow highlighted and bolded.
- Mean differences were calculated using Fall 2015 mean scores minus Spring 2016 mean scores. Significant mean differences were marked as bold or red. Bold indicates that changes from pre to post aligned with ISEP goals/objectives; while red indicates changes towards undesired direction.
Using the unmatched sample, high school students’ content knowledge assessment scores decreased significantly on 1 of the 20 items from Fall 2015 to Spring 2016 and improved slightly on 13 items, as well as for the overall assessment score (Table 20).

### UB/BPS ISEP STEM Student Questionnaire Data, Fall 2016

As shown in Table 21, 11 STEM undergraduate students and two STEM graduate students (master’s and doctoral students) who participated in the ISEP project in Fall 2016 and responded to the UB/BPS ISEP STEM Student Questionnaire. Among them, five STEM undergraduate and two STEM graduate students indicated that they were returning participants to the ISEP project. Due to small sample size of the Fall 2016 STEM student data, routine analysis of comparing responses between undergraduate and graduate students and between first year and returning participants will not be reported here. Analysis of all UB/BPS ISEP STEM Student Questionnaire data collected from Spring 2013 to Fall 2016 will be reported in the final evaluation report.

Summary and Recommendations

Summary of Evidence of Progress Toward Project Goals

During Year 6 of the ISEP project, the Discovery Center evaluation team turned attention to collecting evidence of project progress toward its major goals. It should be noted that due to data collection cycles that align with the academic year, pre- and post-intervention data analyzed for this report were primarily from ISEP’s fifth year of implementation with teachers (Summer 2015 - Summer 2016). Fall 2015 and Spring 2016 data were collected post-Year 4 from students of ISEP teachers and a well-matched comparison group of students of non-ISEP teachers. Although analyses are not reported in this report, Fall 2016 data also were collected (pre-Year 5) from STEM undergraduate and graduate students and from BPS students of ISEP teachers and a well-matched comparison group of students of non-ISEP teachers. Findings reported herein, though more summative in nature than Year 5 findings, are intended for the purpose of project improvement upon reflection by the ISEP project team. Data were not available to evaluate progress toward some project goals; those instances are noted. Limitations of the evaluation to respond to some questions are based upon lack of sufficient data from comparison teachers’ students to conduct rigorous analyses. During the second no-cost-extension year, evaluators will work with the ISEP project team to collect additional data from ISEP teachers and STEM students and report findings from data collected from all 6 years cumulatively and triangulate findings from multiple data sources to demonstrate project impact.

Findings from the Year 6 evaluation are summarized under each ISEP project goal.

**GOAL 1:** Improve elementary/middle school science teachers’ knowledge and skills related to science inquiry through interdisciplinary science research and engineering design with university STEM faculty.

Three evaluation questions are associated with ISEP project Goal 1:

*Evaluation Question 1: Have elementary/middle school science teachers’ knowledge and skills improved as the result of conducting interdisciplinary science research and engineering design with university STEM faculty?*

Before participating in ISEP activities, teachers indicated higher priority professional development needs related to aspects of science teaching closely aligned with NGSS cross-cutting concepts (i.e., scale, proportion, and quantity; systems and system models; and energy and matter) as well as some aspects of inquiry teaching (i.e., helping students develop the ability to communicate with others an argument based on evidence) than they did following one or more years of participation in ISEP, suggesting that their ISEP experiences had provided opportunities to develop their understanding of interdisciplinary science. On the other hand, teachers reported higher priority professional development needs related to some aspects of inquiry teaching (i.e., the ability to develop and use valid models and to ask questions and define problems, and the ability to obtain, evaluate, and communicate information) after their participation.

Regarding development of teachers’ knowledge and skills, statistically significant improvements after one or more years of ISEP participation, included better preparedness to teach science to students from a variety of cultural backgrounds, to encourage participation of females and minorities in science courses, to use a variety of technological tools to enhance student learning, and to teach interdisciplinary science inquiry following one year of ISEP participation. Teachers’ preparedness for science instruction has been sustained over their years of participation. Specifically, teachers reported that they were significantly
better prepared to lead students using investigative strategies and to teach interdisciplinary science inquiry following four years of ISEP participation, compared to their baseline responses.

Following one or more years of ISEP participation, teachers reported using more Design, Engineering, and Technology (DET) activities in classrooms and having more school support in using DET activities.

**Evaluation Question 2: Have elementary/middle school science teachers improved their understanding of the Nature of Science and inquiry science teaching?**

Compared to their baseline responses, teachers reported that they were better able to clarify some misunderstanding of scientific inquiry (i.e., less agreement with the statements such as “inquiry-based learning requires learners first understand basic science concepts prior to engaging in inquiry activities” and that “inquiry-based learning requires learners to engage in hands-on activities”) after participating in ISEP for one or more years.

Although not statistically significant, compared to their baseline responses, teachers reported less agreement with some accurate understandings of the teacher’s role in inquiry-based teaching following three or four years of ISEP participation (i.e., inquiry-based teaching requires that the teacher act as a facilitator or guide of student learning rather than as a disseminator of knowledge., inquiry-based teaching focuses more on what the students do, rather than on what the teacher does, and inquiry-based teaching requires that the teacher have a strong background in the science content related to the inquiry.)

Although not statistically significant, following one year of participation in ISEP activities, teacher participants agreed more with the accurate understandings that scientific knowledge is reliable and durable so having confidence in scientific knowledge is reasonable; and scientific laws are generalizations or universal relationships about some aspect of the natural world and how it behaves under certain conditions.

Following two years of ISEP participation, teachers demonstrated both fewer misconceptions and fewer accurate understandings of the nature of science. Compared to their baseline responses, teachers agreed less that a universal step-by-step scientific method is used by all scientists and scientific experiments are the only means used to develop scientific knowledge; but also agreed less that with new evidence and/or interpretation, existing scientific ideas are replaced or supplemented by newer ones; scientific theories are inferred explanations of some aspect of the natural world; scientific conclusions are to some extent influenced by the social and cultural context of the researcher; and scientific observations are to some extent influenced by the observer’s experiences and expectations.

Following four years of ISEP participation, teachers started to report more positive changes regarding their understanding of the nature of science. For example, after participation in ISEP for 4 years, teachers agreed significantly less that cultural values and expectations do not influence scientific research because scientists are trained to conduct unbiased studies and that scientists do not use their imagination and creativity because these can interfere with objectivity. Although not statistically significant, teachers also reported more agreement that scientific knowledge is reliable and durable so having confidence in scientific knowledge is reasonable; with new evidence and/or interpretation, existing scientific ideas are replaced or supplemented by newer ones; the principal product of science is conceptual knowledge about and explanations of the natural world; scientific theories are inferred explanations of some aspect of the natural world; scientific conclusions are to some extent influenced by the social and cultural context of the researcher; and scientific observations are to some extent influenced by the observer's experiences and expectations.

In the final evaluation report, evaluators will use all data collected to date and additional data collected in Fall 2017 to continue to explore ISEP’s impact on participating teachers in this area. Evaluators also will
 utilize teachers’ PCK assessment scores to determine the relationships among teachers’ beliefs about SI and NOS and their reported uses of inquiry in the classroom. The two-dimensional changes in teachers’ accurate understandings and misconceptions of SI and NOS also will be analyzed and demonstrated with data visualizations.

**Evaluation Question 3: Have elementary/middle school science teachers improved their competence in conducting inquiry science teaching?**

Data regarding teachers’ competence in conducting inquiry science in their classrooms were collected from their students, as well as from their own self-report.

Following ISEP participation, teachers reported more agreement that students should have opportunities to experience manipulating materials in the science classroom before teachers introduce scientific vocabulary and less scared by the idea of teaching engineering design concepts.

When comparing pre-post attitudes and opinions of elementary grades students of ISEP participant teachers, students agreed more that science ideas or hypotheses must be supported by evidence; they learned that there are different solutions to science tasks; they used multiple sources of information to learn; they learned about how science is important in the real world, and they worked on science tasks in a group with other students, at the end of the school year, than at the beginning of the year.

Middle school students agreed more that almost all people used science in their jobs; scientific theories can change when new evidence or a new explanation becomes available; they used information and data to support their conclusions; and they worked on science tasks in a group with other students in Spring 2016, than they did in Fall 2015.

**GOAL 2: Increase science teacher quantity, quality, diversity, and retention in urban schools.**

**Evaluation Question 4: Has the total number of highly-qualified science teachers increased? Has the science teacher population become more diverse? Are highly-qualified science teachers being retained in urban schools?**

Data collected prior to their participation in the project indicated that ISEP teachers are primarily experienced teachers, with moderate to high levels of prior participation in professional development experiences. Most teachers were credentialed to teach high school science, so reported adequate pre- and in-service preparation in science content generally.

To respond to questions regarding impact of the project on the Buffalo Public Schools, publically available school-level data were collected and analyzed to compare aggregate teacher information for each ISEP partner school between 2010-2011 and 2015-2016. A limited data set is publically available and data that may respond more directly to the evaluation question will need to be obtained from the BPS central administration. Since aggregated information exclusively for science teachers is not available on the New York State School Report Card or other publicly available data sources, information were reported for all teachers in the ISEP partner schools. Evaluators will continue to work with ISEP project personnel to collect key data that inform questions about improvement in science teacher quality and diversity and impact at the school and district level.

From 2010-2011 to 2015-2016, the percentage of teachers teaching without an appropriate license/certificate decreased at 2 of the 12 ISEP partner schools; the percentage of teachers with a Master’s plus 30 hours or doctorate degree increased at 9 schools; and the percentage of core courses not taught by highly qualified teachers decreased at 3 schools. The turnover rates from 2014-2015 school year to 2015-2016 school year for teachers with fewer than 5 years of experience and for all teachers were not available at the school level.
GOAL 3: Develop and sustain professional learning communities in urban schools, based on mentoring models, with help from university STEM faculty and graduate students.

Evaluation Question 9: Are parents actively involved in project activities that support student learning?

No data that are responsive to this question were collected or analyzed by the evaluation team this year. Data regarding parent involvement in ISEP activities are included in the project report.

GOAL 4: Extend interdisciplinary inquiry based science and engineering learning to high school.

Evaluation Question 6: Are high schools with participating students implementing interdisciplinary inquiry in classrooms?

High school students agreed significantly more that they talked with other students about how to do a science task or about how to interpret the data from an experiment; learned from other students; considered different scientific explanations; had a say in deciding what activities they do; used a computer or the Internet for science assignments or activities; wrote about how they solved a science task or about what they were learning; learned that there were different solutions to science tasks, and used multiple sources of information to learn in their science classes in Spring 2016, than they did in Fall 2015.

Teacher reports of implementing inquiry in their classrooms have not been disaggregated by grade level in order to explore if high school teachers’ reports of implementing inquiry are congruent with students’ perceptions. In the final report, the evaluation team will disaggregate these data to the extent possible (without compromising participant confidentiality) to report on any differences between levels of implementation of inquiry in elementary, middle, and high school classrooms.

GOAL 5: Improve student achievement in science, attitude toward science-technology-society, and interest in pursuing advanced science studies.

Evaluation Question 7: Are students achieving higher learning standards in science?

No obvious patterns of increase regarding the percentage of students meeting or exceeding New York State Standards in Grade 8 Science, Regents Earth Science, and/or Regents Chemistry were found between 2010-2011 and 2015-2016.

As a more proximal measure of students’ learning in science, a content assessment was administered in Fall 2015 and Spring 2016 to students of ISEP teachers and to their non-ISEP peers. Analyses using unmatched pre-post responses indicated that elementary school ISEP students’ content knowledge assessment scores improved significantly from Fall 2015 to Spring 2016. Middle school students’ content knowledge scores improved significantly on 1 item from Fall 2015 to Spring 2016 (Table 19). Although not statistically significant, middle school students also scored slightly better on 16 other items and the overall score at the end of the school year. High school students’ content knowledge assessment scores decreased on 1 of the 20 items from Fall 2015 to Spring 2016 and improved slightly on 13 items, as well as the overall score.

Evaluation Question 8: Are students more interested in learning science and pursuing advanced studies in science?

When comparing unmatched pre-post attitudes and opinions of high school students of ISEP participant teachers, students reported greater likelihood to major in an engineering, science, or engineering technical field in college at the end of the 2015-2016 school year.
**GOAL 6:** Improve collaboration in student learning among university, school, and parents.

**Evaluation Question 10:** Are science teachers actively participating in project activities?

Teacher professional development records indicated that 60 teachers participated in the 4- or 6-week summer research activities, five participated in summer courses offered by BSC, and six participated in ELL-related PD activities in Summer 2016.

**Evaluation Question 11:** Are university STEM faculty and students actively participating in project activities that improve K-12 science education?

STEM students’ self-report of involvement in project activities from Spring 2013 to Fall 2016 will be reported in the final evaluation report.

No data have been collected by the external evaluation team to directly assess the participation of faculty in project activities.

In addition to the six project goals that are focused primarily on BPS teachers and students, the ISEP project has three additional objectives for the professional development of STEM undergraduate and graduate students.

**Objective 1:** To develop STEM undergraduate students’ and graduate students’ understanding of the nature of interdisciplinary science inquiry including engineering research.

**Objective 2:** To develop STEM undergraduate students’ and graduate students’ communication skills to promote interdisciplinary science inquiry to middle and high school science teachers and students.

**Objective 3:** To develop STEM undergraduate students’ and graduate students’ appreciation of professional learning communities and collaborative skills to actively contribute to the PLCs.

These objectives will be evaluated in the final evaluation report with the new **UB/BPS ISEP STEM Student Questionnaire** data that will be collected in Fall 2017 and findings of the ISEP Research Team regarding these objectives. These objectives are:

---

**Observations and Recommendations**

Based upon the findings of the external evaluation, the Discovery Center makes the following recommendations for the second no-cost-extension year:

1. Evaluators with collaborate with project internal evaluation and research teams to collect more **UB/BPS ISEP Teacher Questionnaire** and **UB/BPS ISEP STEM Student Questionnaire** data in Fall 2017.

2. Evaluators will synthesize the results from **UB/BPS ISEP Teacher Questionnaire** collected from Summer 2012 to Fall 2017 with teacher PCK data and with data on teachers’ participation in school-year project professional development workshop sessions provided by the project team. These analyses will explore the contributions of summer PD experience and school-year follow-up experience to teachers’ acquisition of knowledge and skill related to project goals at the individual level, though data will be reported in aggregate. For teachers involved in ISEP multiple years, additional analyses will be conducted to determine if and how teachers’ perceptions of preparedness and attitudes toward interdisciplinary science teaching, understandings of the Nature of Science and classroom inquiry, and familiarity with design, engineering and technology changed following participation in ISEP project activities.

**Evaluation of UB/BPS ISEP**
3. In order to continue to test the psychometric properties of the UB/BPS ISEP Teacher and the US/BPS ISEP Student Questionnaire, the Discovery Center will repeat the factor analyses and reliability tests using all teacher and student pre/post data up-to-date to determine if the performance of some subscales, particularly on the student instrument, are improved and will make recommendations for modification to the instruments, if necessary. The objective of the evaluation is to establish valid factors for each instrument subscale with the ISEP target populations so that data can be analyzed at the construct level (factor level) and the Rasch model can be used to transform and compare data across project years and participant groups.

4. Once valid factors can be established for the lower performing subscales (i.e., Science as Inquiry, Understanding the Nature of Science) of the UB/BPS ISEP Teacher Questionnaire, evaluators will continue to explore how teachers’ progressive acquisition of understanding of the Nature of Science and classroom inquiry interact with teachers’ misconceptions regarding scientific inquiry and Nature of Science, as components of the teachers’ belief system regarding teaching and learning.

5. Evaluators will synthesize ISEP teachers’ knowledge, attitudes, and beliefs data with student attitudes and content knowledge data to estimate the impact of ISEP on student outcomes.

6. Evaluators will combined all STEM student data with the newly collect data in Fall 2017 to estimate ISEP impact on STEM undergraduate and graduate students.
4. b. Response to External Evaluation Report

Joseph A. Gardella, Jr. and Xiufeng Liu

The external evaluation provided useful feedback on the project’s progress toward achieving its stated goals. Specifically,

1. **Goal 1: Improving teacher knowledge and skills related to inquiry science teaching**

We are pleased to see the findings that overall teacher knowledge and skills on interdisciplinary science inquiry has increased as they participate in ISEP activities, and that their understanding of nature of science has also improved as the result of their participation in ISEP.

Last year’s decision to plan specific sessions during the academic year to help teachers reflect on their summer research experiences in order to develop more appropriate understanding of the inquiry based teaching and experimental work had strong impact. The new workshop/presentations occurred in academic year professional development as part of ISEP. The new structure of academic year content PD with support from New York State Education MSP funding made this possible to a wide audience of teachers. ISEP teachers will be required to write an essay response to these presentations.

The evaluation also found that students of ISEP teachers reported more learning activities consistent with science inquiry than students of non-ISEP teachers. This is assuring in that ISEP teachers demonstrated change in their teaching approaches. We believe this finding might largely be due to the presence in the classrooms of STEM graduate students and undergraduate service learning students. The variety of out-of-school activities facilitated by STEM students might have also contributed to this positive change in student learning.

2. **Goal 2: Increasing teacher quality, quantity, diversity and retention.**

Although the evaluation found some possible signs toward achieving the above stated goal, we are cautious in making any conclusive statement on our progress toward achieving this goal. This is because there are many factors outside the control of the ISEP project working against achieving the above goal. These factors include but not limited to decreasing student enrollment in some ISEP schools, State accountability measures that result in closing or restructuring some ISEP schools, and teacher low morale due to ongoing instability in the school district leadership and stalemate in contract negotiation. Nonetheless, we are pleased that over the past six years, a large number of BPS science teachers have participated in ISEP activities and their quality in terms of their knowledge and understanding of interdisciplinary science inquiry and their ability to implemented interdisciplinary science inquiry in their classrooms has increased.

3. **Goal 3: Developing and sustaining PLCs**

PLCs established over the years in ISEP schools have been sustaining as reported in our year-long ethnographic studies (please refer to the Research section of this report).
The shift away from managing the Parent PLC was a loss for our parents that were used to working directly to link ISEP to their children, but the plan this year to expand attention to parent leadership in collaboration with BPS district initiatives that was described in Section 1 worked well. Creating a more successful model for the teacher based PLCs is underway with a more serious emphasis on a limited and regular set of PLC face to face meetings, and implementation of social network off line discussion using EdWeb. As an outcome of the subject based teacher PLCs with middle and high school teachers that were formed for summer 2016 and met at a regular, fixed time twice during the summer.

4. Extending interdisciplinary science inquiry from middle school to high school

Although evaluation did not find enough evidence on the continuation of interdisciplinary science inquiry from middle school to high school, we expect that as more students progress from middle school to high school in ISEP schools, we will see more positive evidence on this continuation of interdisciplinary inquiry over grades.

5. Improving student achievement, attitude and interest in science

We are very pleased to know that evaluation found improved student attitude and interest in science after participating in ISEP summer activities. This area was a struggle in years 1 and 2 and significant increases were made in summer in year 3 and 4. This seems to confirm that our approach of year round wrap around support for students is a necessary component to keep and grow student interest. Our education research team also found statistically significant causal effects of teacher participation in ISEP and improved student understanding of cross-cutting concepts (please refer to findings in the Research section of this report).

6. Improving collaboration among project partners

We are very pleased that participation of ISEP school teachers, STEM students and undergraduate service learning students was extremely high. Although no data were collected on university STEM faculty, our experiences over the past five years suggest that university faculty are very enthusiastic and supportive of the ISEP project.

The external evaluation also found some positive outcomes related to STEM students. We realized that in the past few years, we focused more on the process of STEM students developing science communication skills. This year we paid more attention to collecting data on STEM students achieving other project goals including understanding the nature of interdisciplinary science inquiry, appreciation of PLCs, and developing collaborative skills. We will facilitate data collection by the external evaluator on the above measures.

This year, and presently during the second no cost extension, we have been concluding our work with our external evaluator to synthesize all pieces of data collected from both external evaluation by the external evaluator and internal evaluation by the research team. As noted we conducted structure equation modeling to test various hypotheses on possible causal relations among variables related to
students (e.g., achievement, attitude and interest in science), teachers (e.g., participation in summer research and ongoing professional development along with their demographics), school characteristics, and parent involvement in student learning. These were published in Dr. Yang Yang’s dissertation and the two resulting papers highlighted in section 1.

<sup>a</sup> This number was calculated using (Number going to 4 year + Number going to 2 year + Number going to other postsecondary)/Number of Completers.

<sup>c</sup> All State Regents data for 2010-2011 were from 2009-2010.

<sup>d</sup> Graduation rates in 2010-2011 were based on the 2007 four-year cohort for accountability.
Section 5: Implementation Plan

University at Buffalo/ Buffalo Public Schools ISEP

Year 6: 2016-2017 No Cost Extension

ISEP Year 7 Plan: August 2017 – February 2018

For Year 7 we anticipate full implementation of the results from summer 2016 and 2017 professional development and detailed in grant application and in 5-year plan including the following categories which are detailed in the following chart:

- School-based wrap-around supports, especially results of summer student activities
- PLC’s
- Research & evaluation
- Develop and Execute Sustainability Plan for future funding
- Develop an ecosystem based Theory of Action

<tr>
<td>Examine results of students from each school in summer research opportunities or middle school summer camps and identify follow up academic year activities for continuing emphasis on student development</td>
<td>Meet with school based parent group to plan activities.</td>
<td>Review building supplies and equipment requests.</td>
<td>Ongoing partner events including family nights at BMS</td>
</tr>
<tr>
<td>Develop student focused leadership and STEM activities to develop mentoring and academic success in STEM with measures reflecting Common Core standards</td>
<td>GA’s and RA’s support in-class and afterschool activities and service learning students; in-school and afterschool activities</td>
<td>Ongoing purchasing of STEM related equipment as determined through collaborative discussions and planning with school and district leadership</td>
<td>Announcement of summer camps for middle school students and summer research internship opportunities for high school students</td>
</tr>
<tr>
<td><strong>PLC’s</strong></td>
<td>Communication to invited new member participation in PLCs and initial meeting with participants</td>
<td>Teachers engaged in summer research prepare products to share through PLC’s</td>
<td>Continue social network tools for each PLC</td>
</tr>
</tbody>
</table>
**Evaluation**

- Analyze UB/BPS ISEP Teacher Questionnaire pre/post comparisons
- Analyze BPS ISEP Student Questionnaire data from treatment and comparison students- Winter 2018
- Collect 2016-2017 School/classroom/teacher-level demographic data
- Collaborate with the Research Team to develop and pilot test Teacher Content and PCK Assessment
- Observation and informal interviews of ISEP teacher participants, STEM students, and faculty during summer lab experiences
- Administer instrument to assess student summer program experiences
- Administer pre-intervention instruments to measure changes in BPS students’ perceptions of science and engineering (UB/ BPS ISEP Student Questionnaire)
- Administer UB/BSC Faculty Questionnaire
- Ongoing collection of data and monitoring of ISEP components and responding to project team needs
- Administer and analyze STEM Student Survey data
- Analyze BPS student summer program experience data
- Meet with ISEP Project Team on site
- Administer and analyze fully developed instruments measuring content knowledge and pedagogical content knowledge (UB/ BPS ISEP STEM Teacher Content Knowledge & Pedagogical Content Knowledge Assessments)
- Ongoing collection of data and monitoring of ISEP components and responding to project team needs
- Administer and analyze STEM Student Survey Data
- Meet with ISEP Project Team on site
- Administer post-intervention instruments to measure changes in BPS students’ perceptions of science and engineering (UB/ BPS ISEP Student Questionnaire)
- Administer UB/BPS ISEP Teacher Questionnaire
- Ongoing collection of data and monitoring of ISEP components and responding to project team needs
- Preparing for evaluation of summer research components and final activities in schools and revision of evaluation plan as necessary
